

Full Jet-Reconstruction in STAR

Jörn Putschke
for the STAR collaboration
(Yale University)

Jets in p+p and d+Au reference

- Inclusive jet spectrum and fragmentation functions in p+p
- A look at the underlying p+p event (Initial/Final-state radiation)
- Nuclear k_T in d+Au

Jets in heavy-ion collisions

- Inclusive jet spectrum and jet R_{AA}
- Jet energy profile
- Di-Jet coincidence/Hadron-Jet measurements
- (Modified) Fragmentation function
- Jet-Hadron correlations

Towards a complete study of jet-quenching

Di-hadrons are indirect measurements of jet quenching !

To study the full spectrum of jet quenching
in an unbiased way we need new techniques

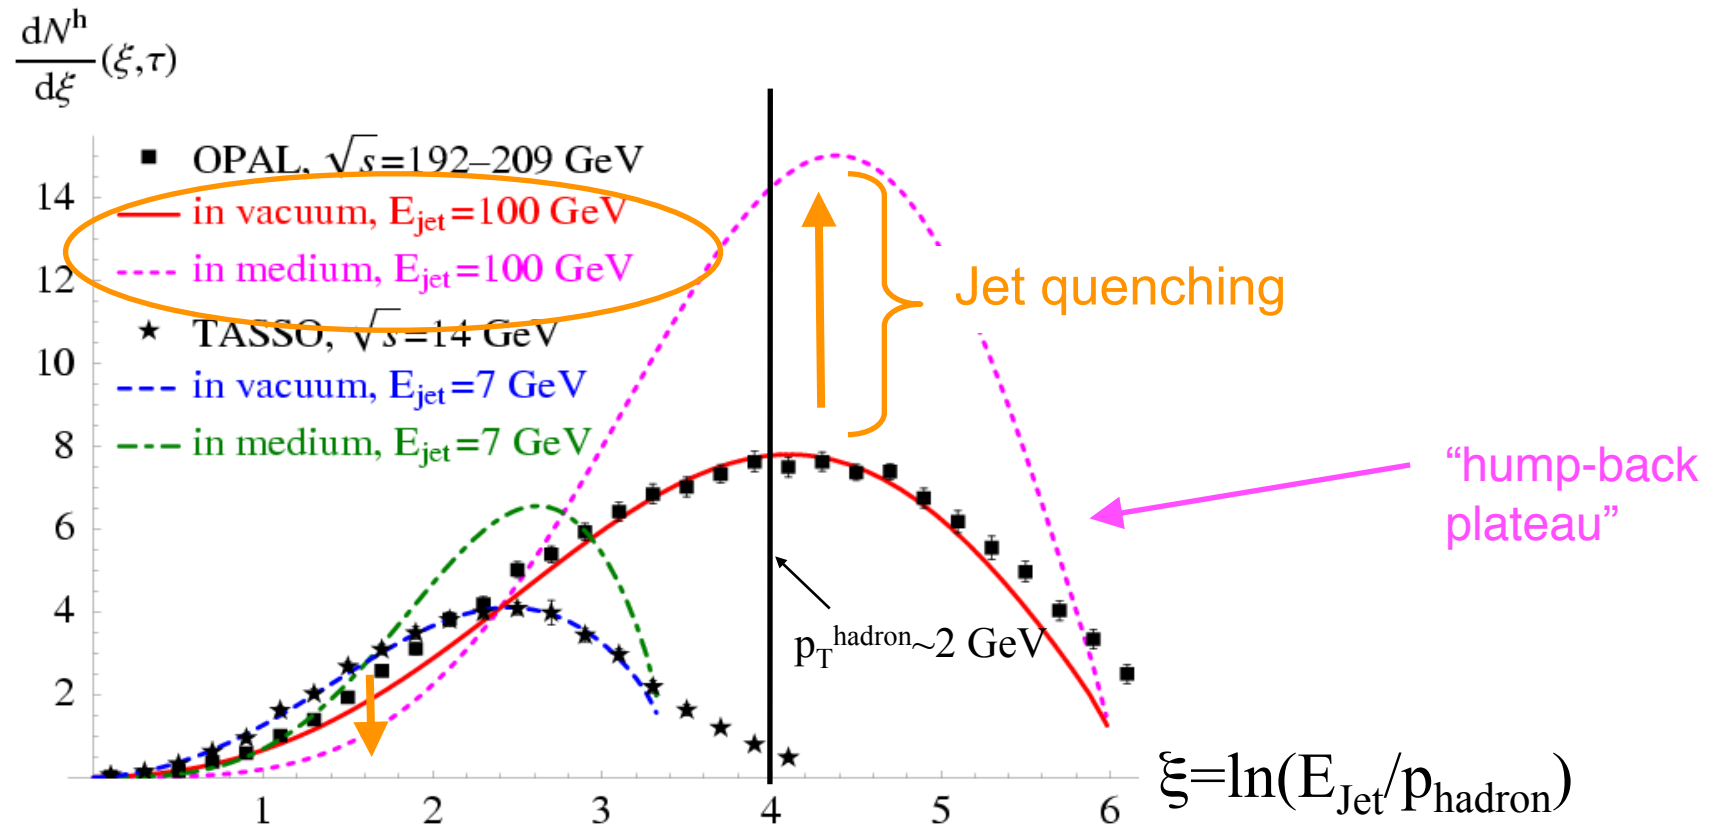

Two approaches:

1. γ -jet: clean, but limited
kinematic reach due to x-section

2. Full jet reconstruction:
large kinematic reach, but
complex analysis

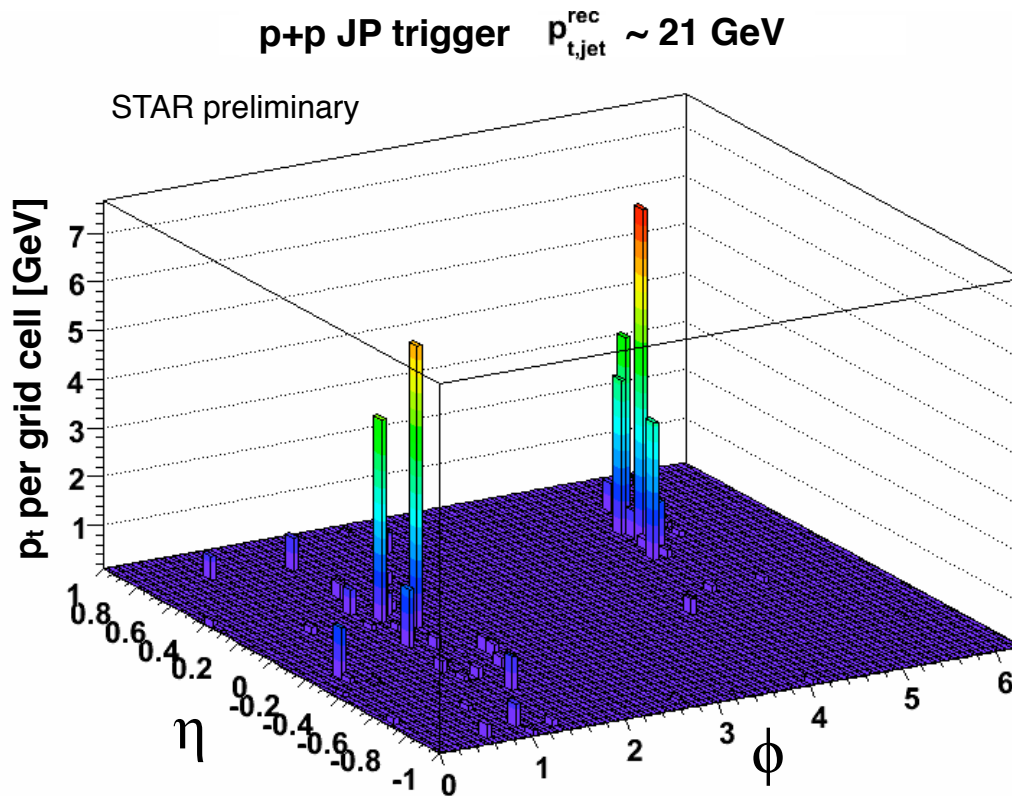

Benchmark observable: modified fragmentation function

- MLLA: good description of vacuum fragmentation (basis of PYTHIA)
- Introduce medium effects at parton splitting *Borghini and Wiedemann, hep-ph/0506218*

Jet quenching \Rightarrow fragmentation should be strongly modified at $p_T^{\text{hadron}} \sim 1-5$ GeV

Can we measure this at RHIC @ 200 GeV ?

Jet-finding is performed on a “grid” using p_t/E_t from:

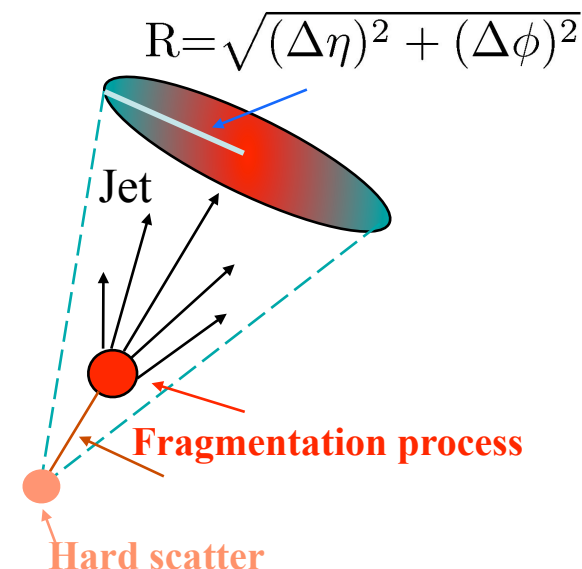

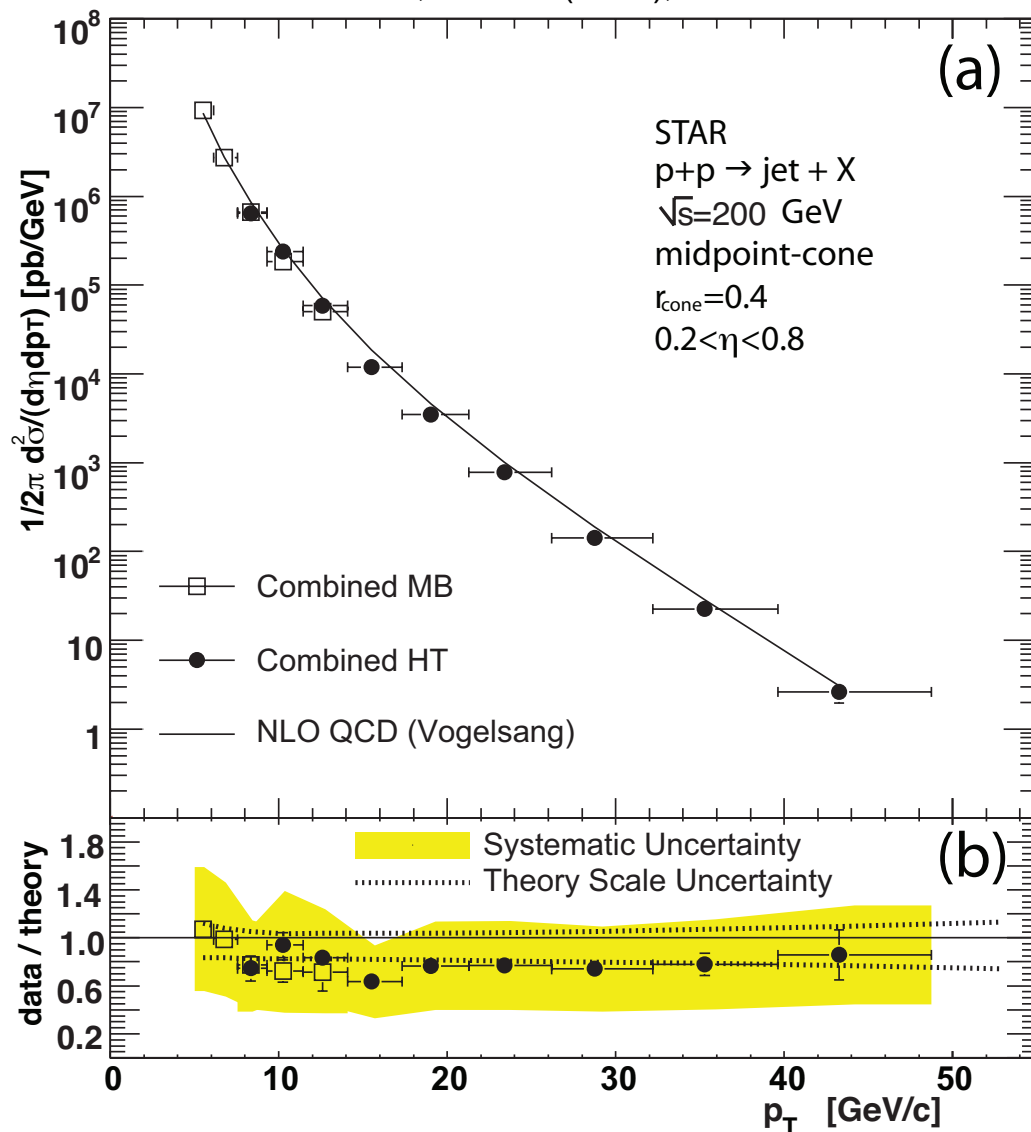

- charged particle p_t (TPC)
- neutral tower E_t 0.05×0.05 ($\eta \times \phi$) (EMC)
- corrected for hadronic energy.
- Electron correction applied.
- EMC provides fast trigger.

Analyzed STAR data-sets:

- *p+p (2006) High-Tower (HT) trigger (single tower $E_t > 5.4$ GeV)*
- *p+p (2006) Jet-Patch (JP) trigger ($\eta \times \phi = 1 \times 1$ with sum $E_t > 8$ GeV)*
- *Au+Au (2007) High-Tower (HT) trigger ($E_t > 5.4$ GeV)*
- *Au+Au (2007) Minimum-Bias (MB) trigger*

Reference: jet x-section in p+p collisions

STAR, PRL 97 (2006), 252001

Jet cross-section in p+p is well described in pQCD framework over 7 orders of magnitude

**Look now at the real jet fragmentation function:
 $z=p_t/E_{\text{jet}}$ and $\xi=\ln(1/z)$**

Reference: Charged ξ Jet Fragmentation in p+p

JP trigger

$$|\eta_{\text{jet}}| < 1 \cdot R$$

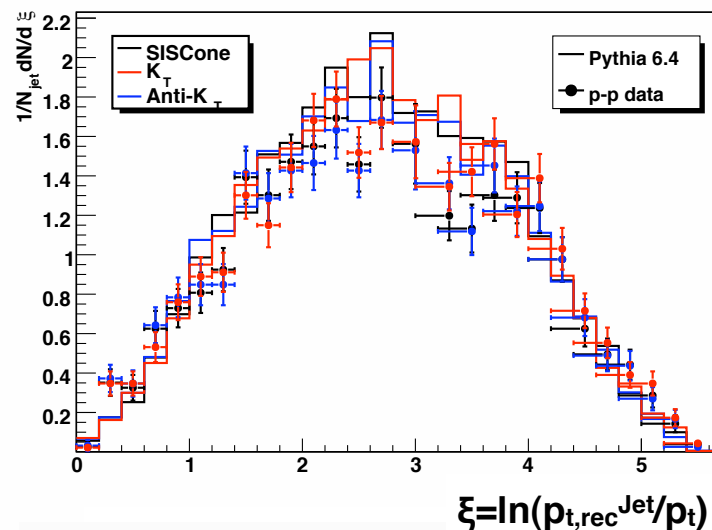

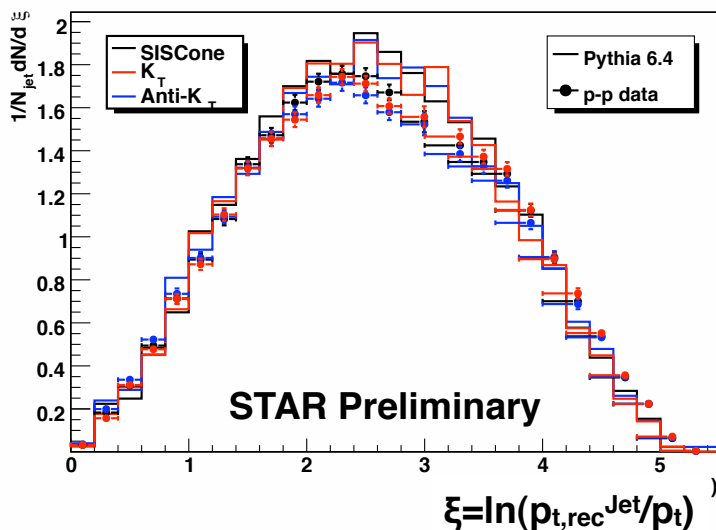

Data not corrected for particle level

Increasing
Jet Energy

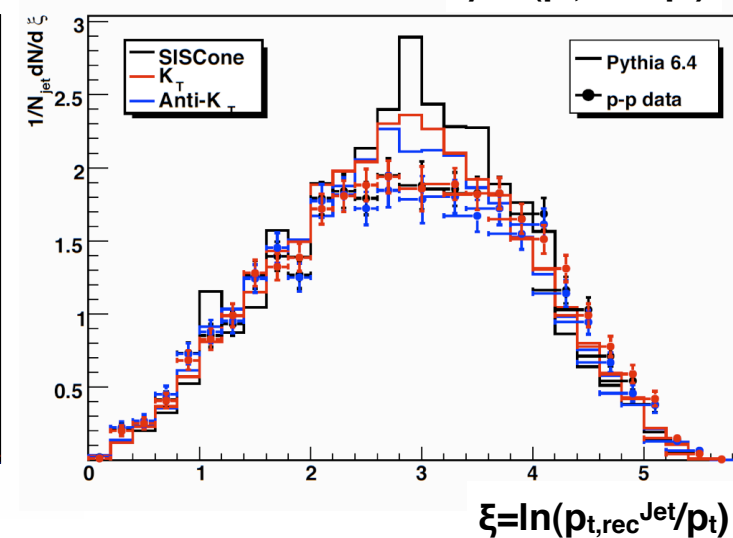

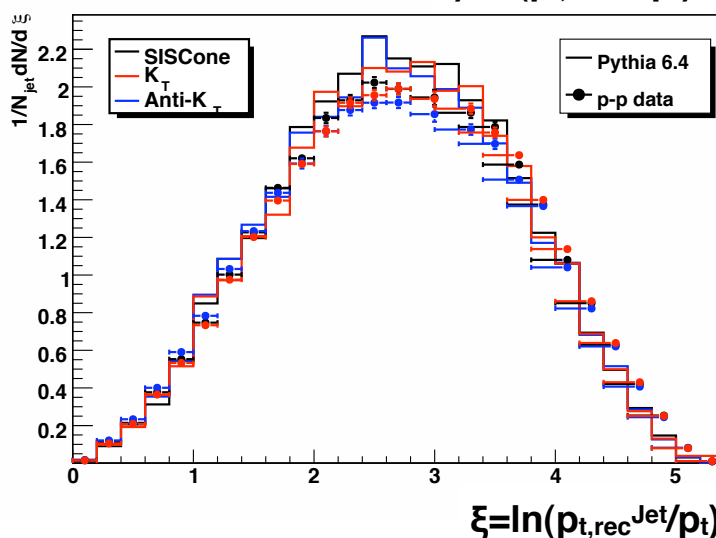

20 < E_{reco} < 30 GeV

30 < E_{reco} < 40 GeV

R < 0.4

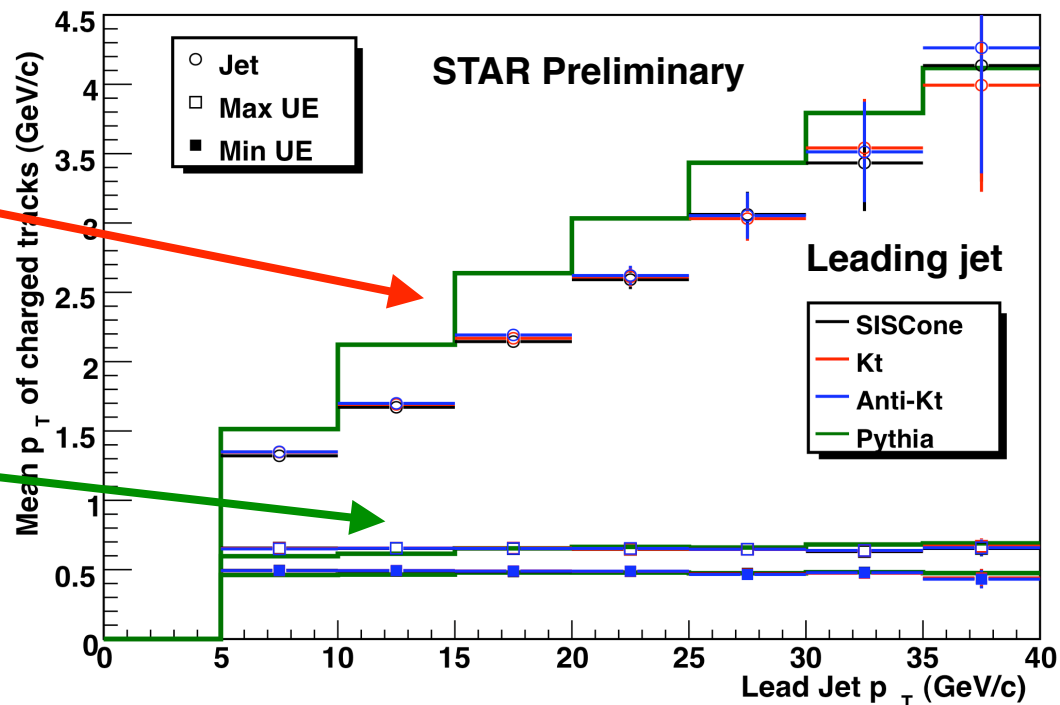

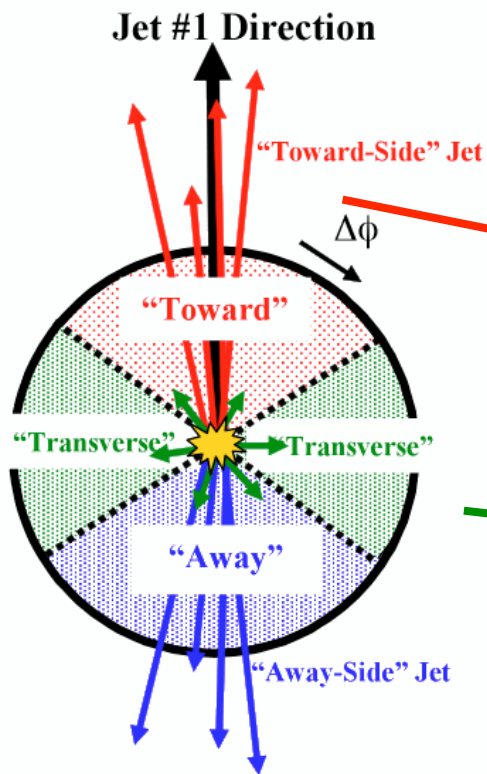

R < 0.7

Increasing
Cone R

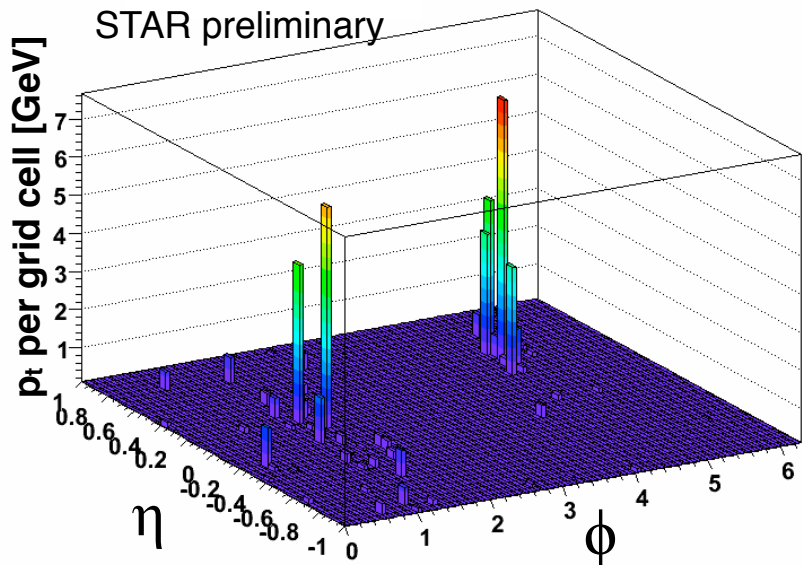

Reasonable agreement with Pythia+Geant
simulations for different R and jet p_t

The underlying event in p+p collisions

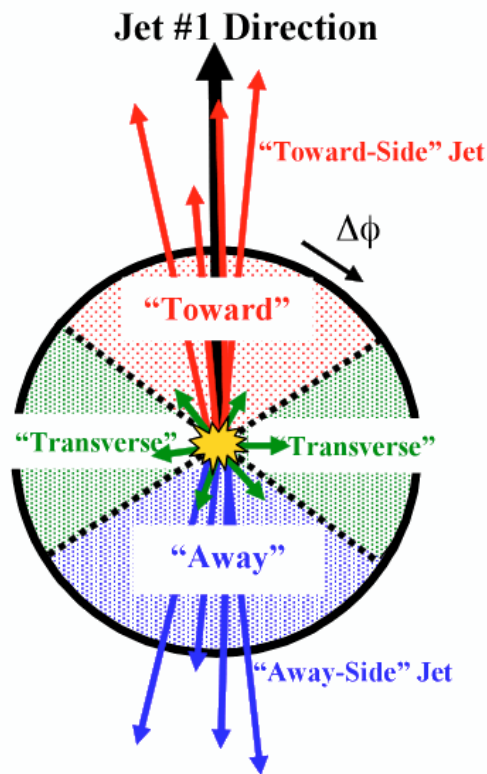

p+p JP trigger $p_{t,jet}^{rec} \sim 21$ GeV

STAR preliminary

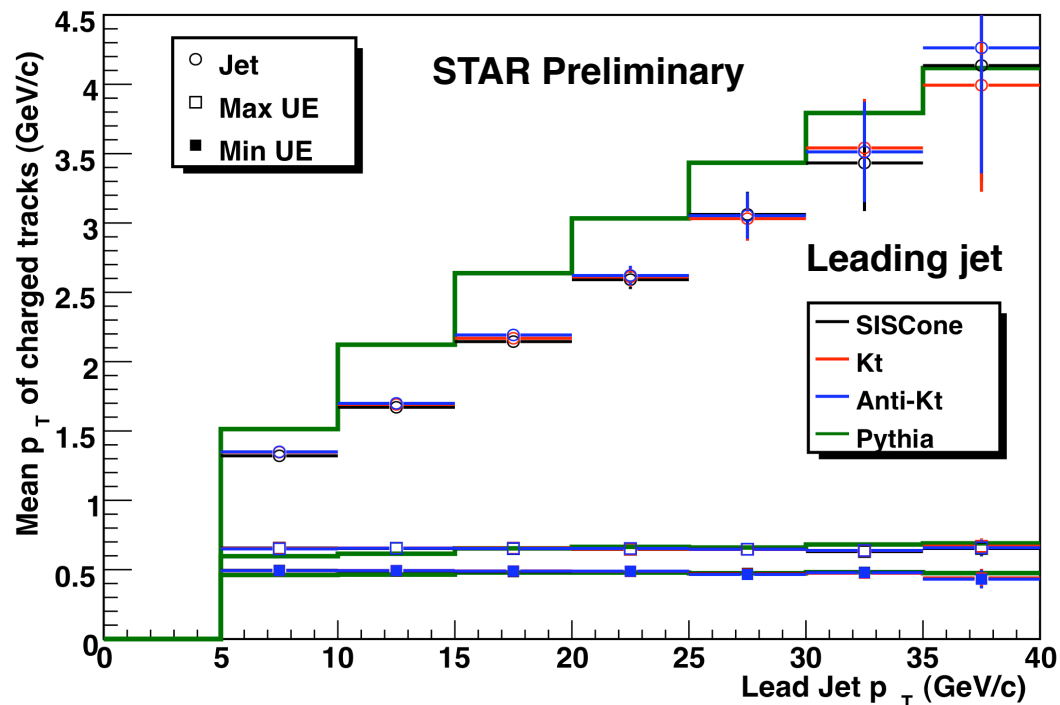

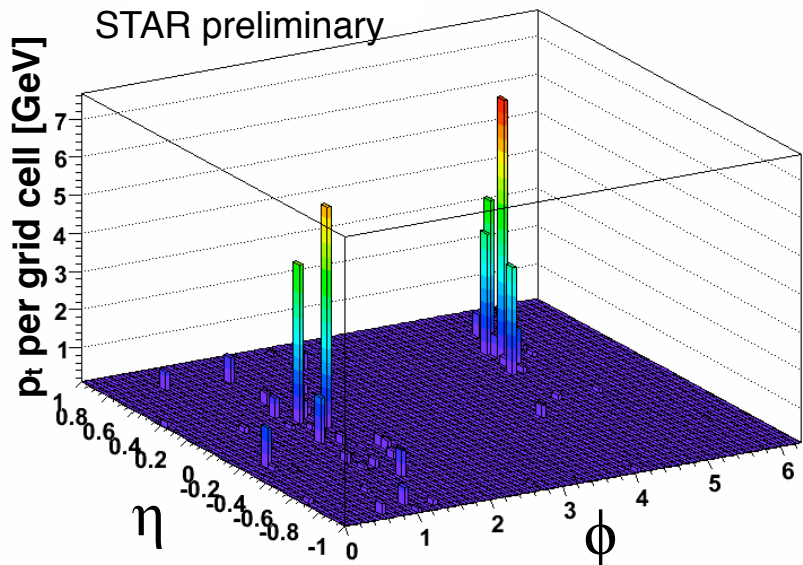

- Underlying event is decoupled from the hard scattering
- Small initial and final state radiation at large angles at RHIC energies

The underlying event in p+p collisions

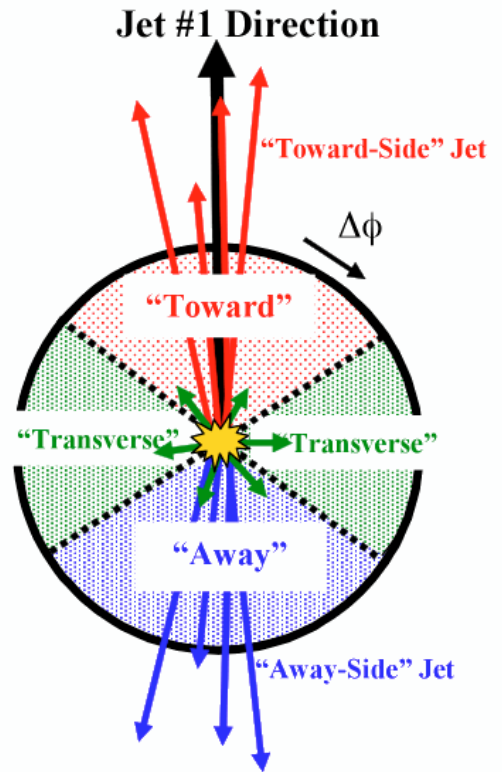

p+p JP trigger $p_{t,jet}^{rec} \sim 21$ GeV

STAR preliminary

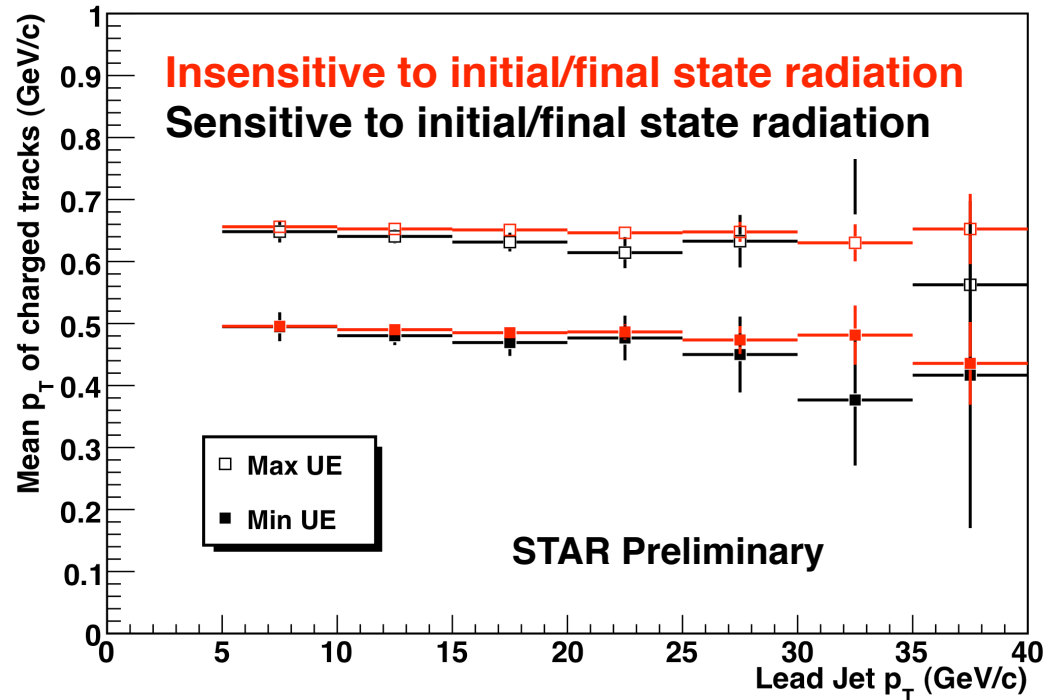

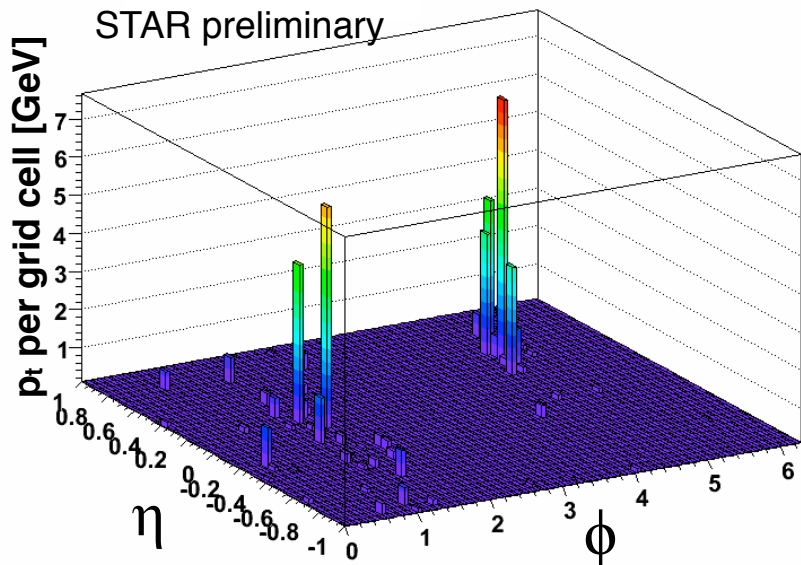

- Underlying event is decoupled from the hard scattering
- Small initial and final state radiation at large angles at RHIC energies

The underlying event in p+p collisions

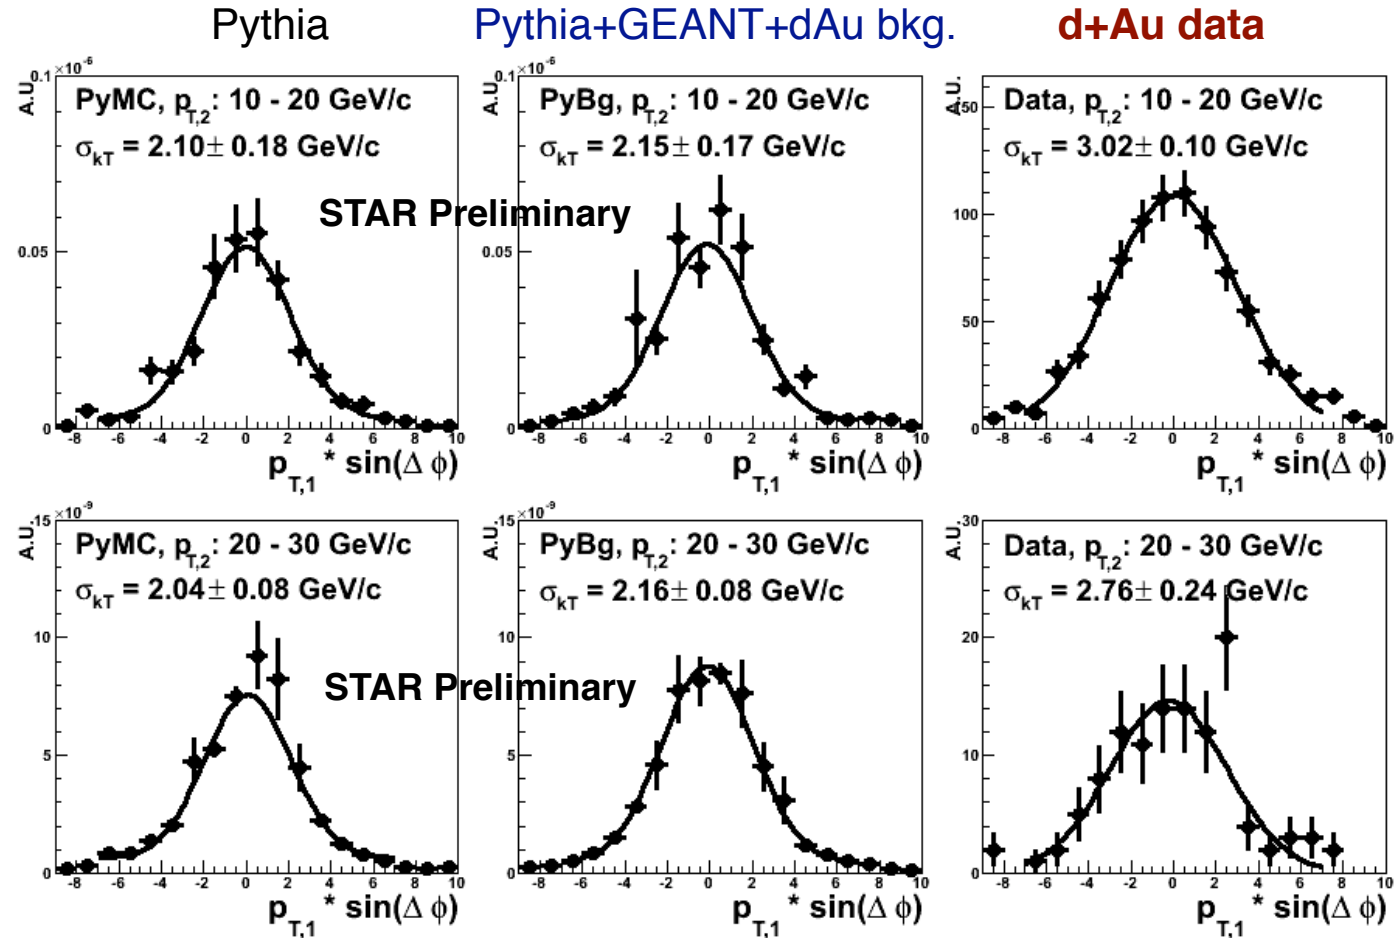

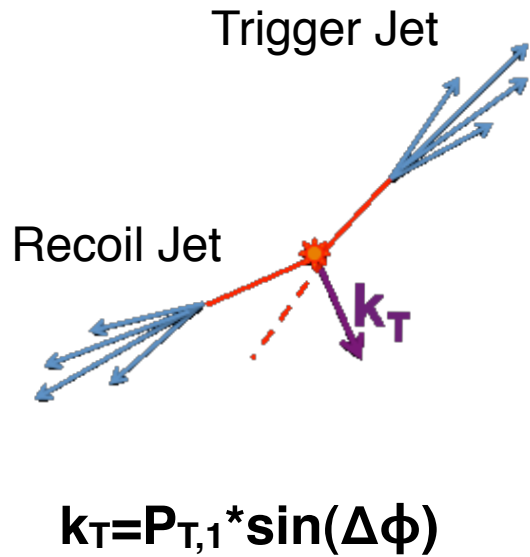

p+p JP trigger $p_{t,jet}^{rec} \sim 21$ GeV

- Underlying event is decoupled from the hard scattering
- Small initial and final state radiation at large angles at RHIC energies

Measurement of nuclear k_T via di-jets in d+Au

Measure σ_{k_T} via di-jets in d+Au (p+p):

p+p: $\sigma_{k_T} = 2.08 \pm 0.12$ (stat) ± 0.13 (sys) GeV/c

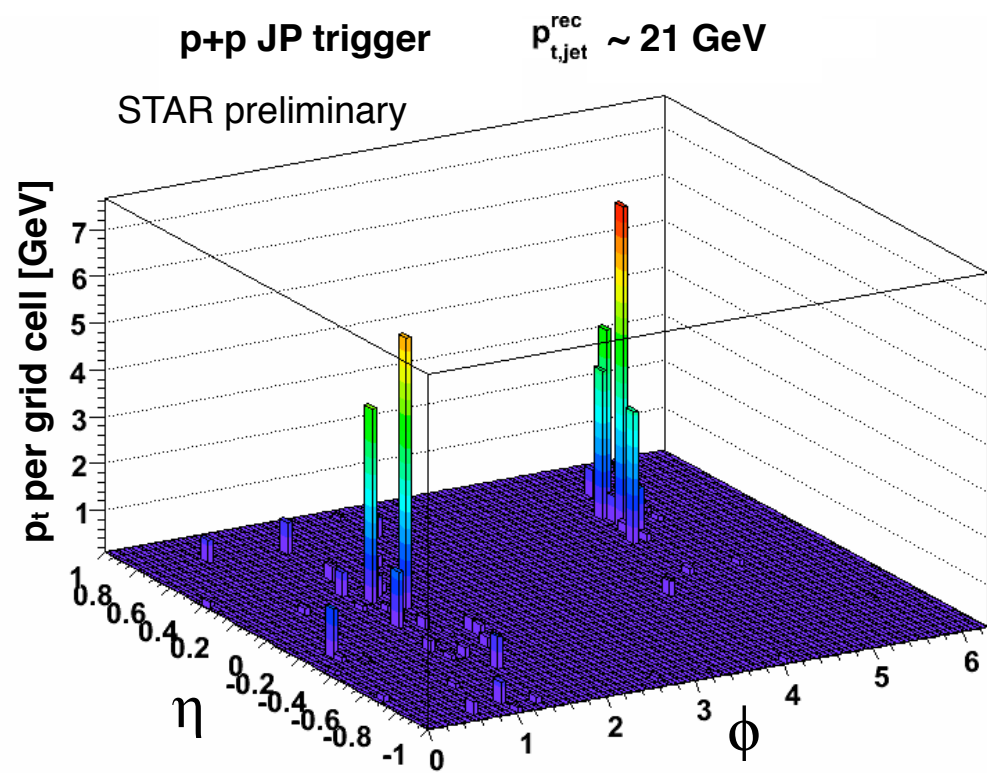

d+Au (0-20%): $\sigma_{k_T} = 3.0 \pm 0.1$ (stat) ± 0.4 (sys) GeV/c (further systematics under evaluation)

Measurement of the initial state k_T in d+Au collisions feasible with the current data !

T. Henry (STAR Collaboration), PhD thesis, Texas A&M University, 2006

Full-Jet reconstruction in HI collisions

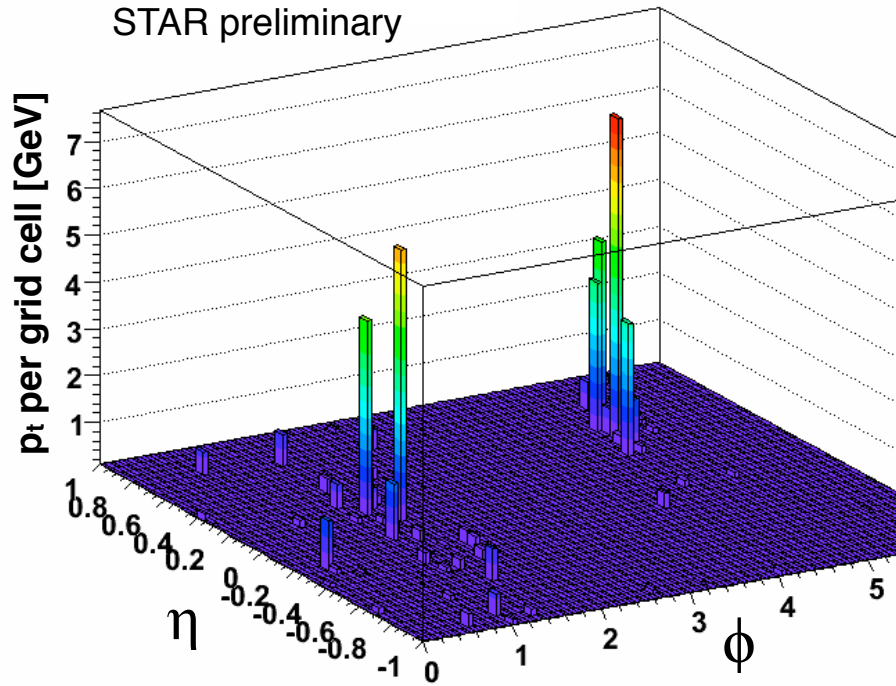

Full-Jet reconstruction in HI collisions

p+p JP trigger

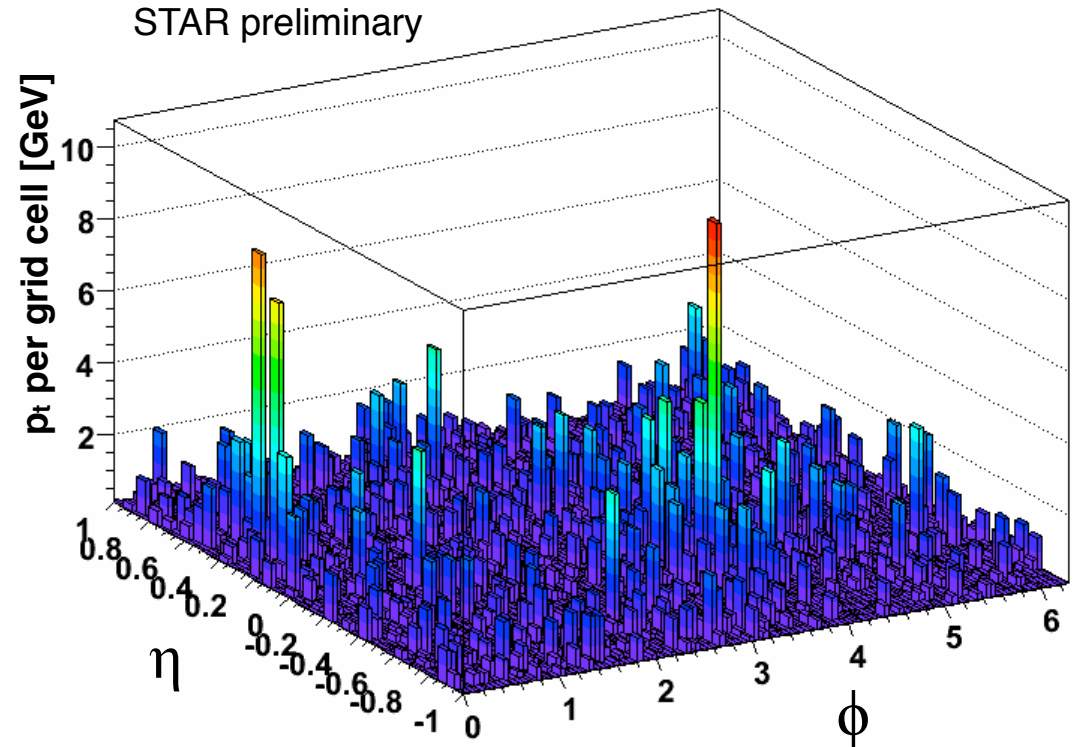

$p_{t,jet}^{rec} \sim 21$ GeV

STAR preliminary

Au+Au 0-20% $p_{t,jet}^{rec} \sim 21$ GeV

STAR preliminary

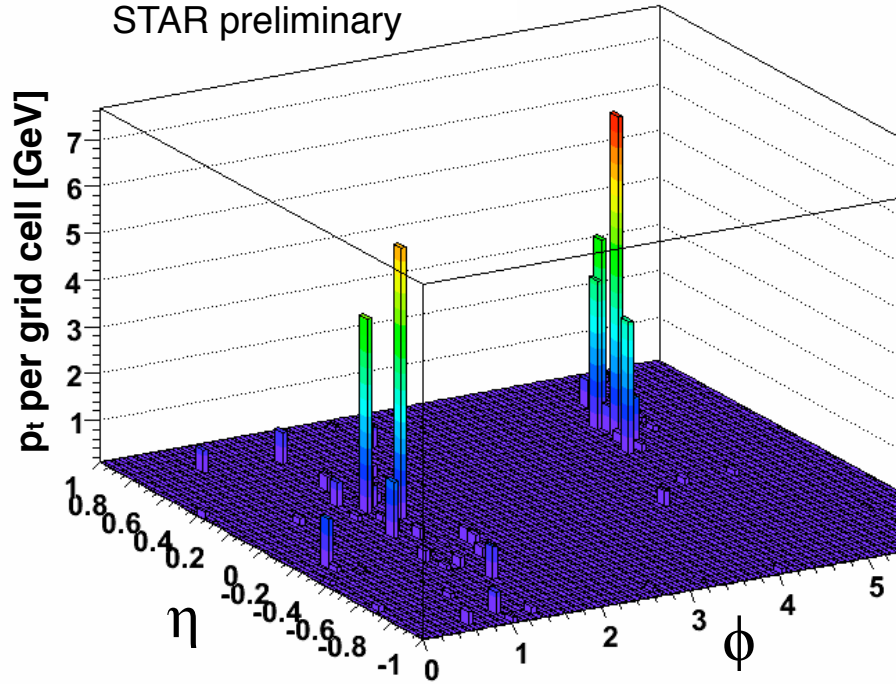

Full-Jet reconstruction in HI collisions

p+p JP trigger

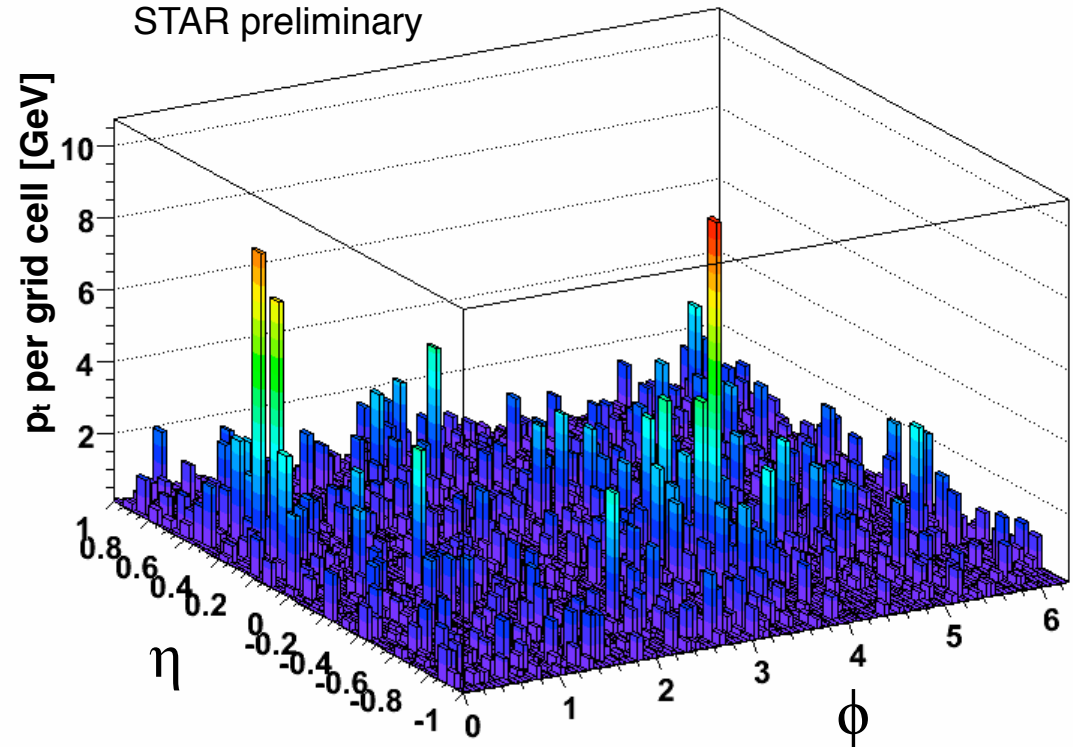

$p_{t,jet}^{rec} \sim 21 \text{ GeV}$

STAR preliminary

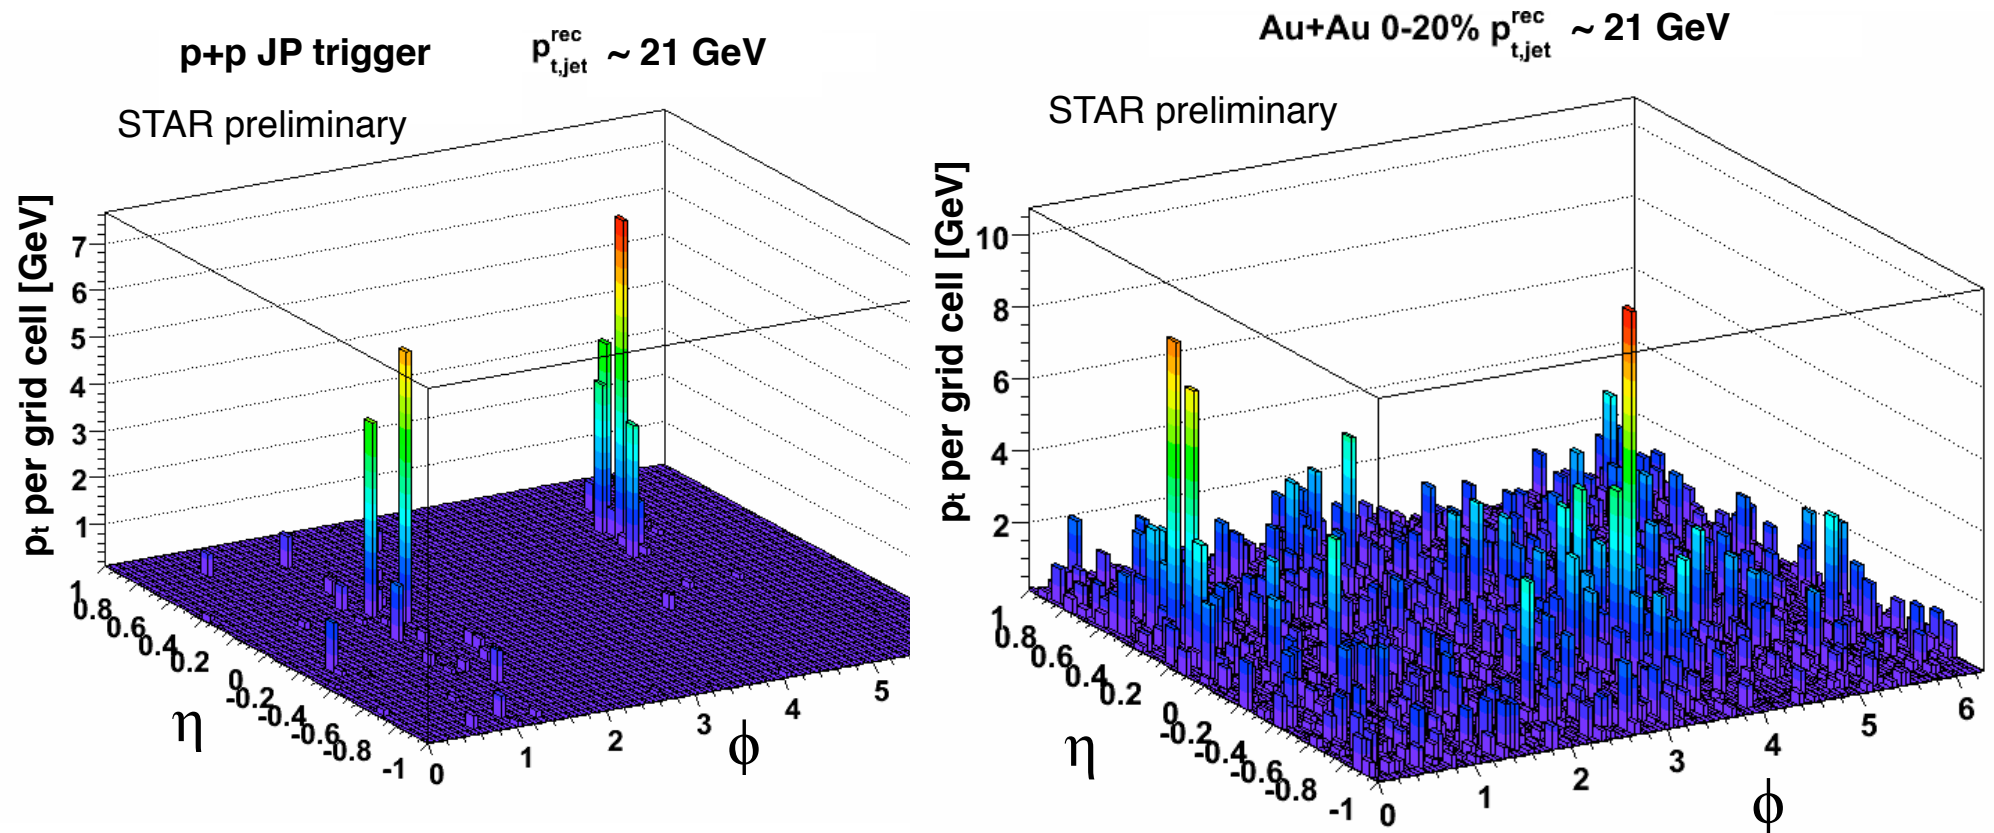

Au+Au 0-20% $p_{t,jet}^{rec} \sim 21 \text{ GeV}$

STAR preliminary

**Full jet reconstruction in HI collisions is a challenge
due to the underlying background !**

Full-Jet reconstruction in HI collisions

**Full jet reconstruction in HI collisions is a challenge
due to the underlying background !**

**But: We have all the tools (FastJet jetfinder) and methods (unfolding)
to correct for background and fluctuations in a data driven approach**

Matteo Cacciari, Gavin P. Salam and Gregory Soyez; arXiv: 0802.1188

Systematic corrections

Trigger corrections:

- p+p trigger bias correction

Particle level corrections:

- Detector effects: efficiency and pT resolution
- “Double* counting” of particle energies
 - * electrons: - double; hadrons: - showering corrections
 - All towers matched to primary tracks are removed from the analysis

Jet level corrections:

- Spectrum shift:
 - Unobserved energy
 - TPC tracking efficiency
- EMC calibration (dominant uncertainty in p+p)
- Jet pT resolution
- Underlying event (dominant uncertainty in Au+Au)

Full assessment of jet energy scale uncertainties

Data driven correction scheme !

Event Background in central Au+Au collisions

Event-by-event basis:

$$p_T (\text{Jet Measured}) \sim p_T (\text{Jet}) + \rho A \pm \sigma \sqrt{A}$$

Underlying background

ρ is the background energy per unit area

A is the jet area

ρ , A estimated from FastJet algorithm

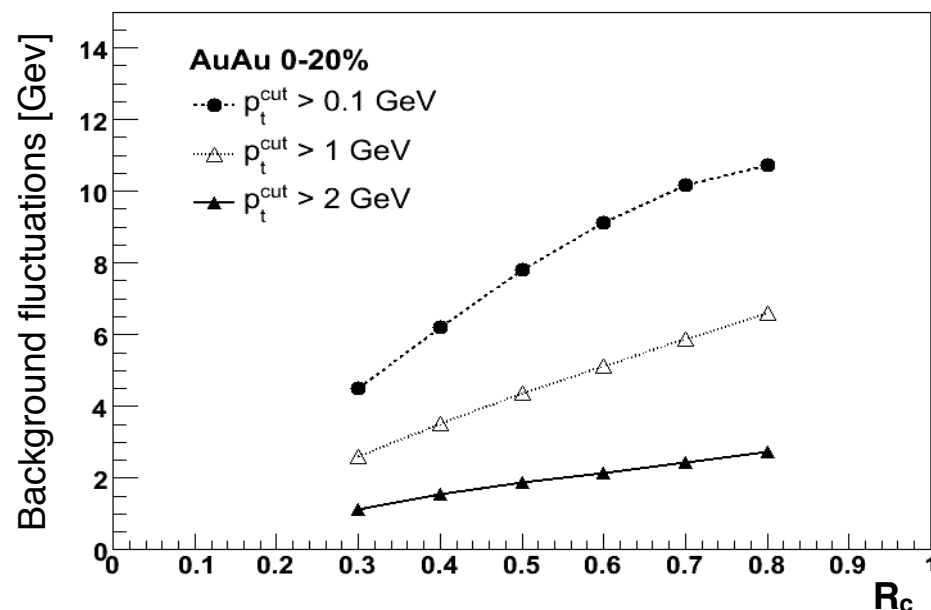

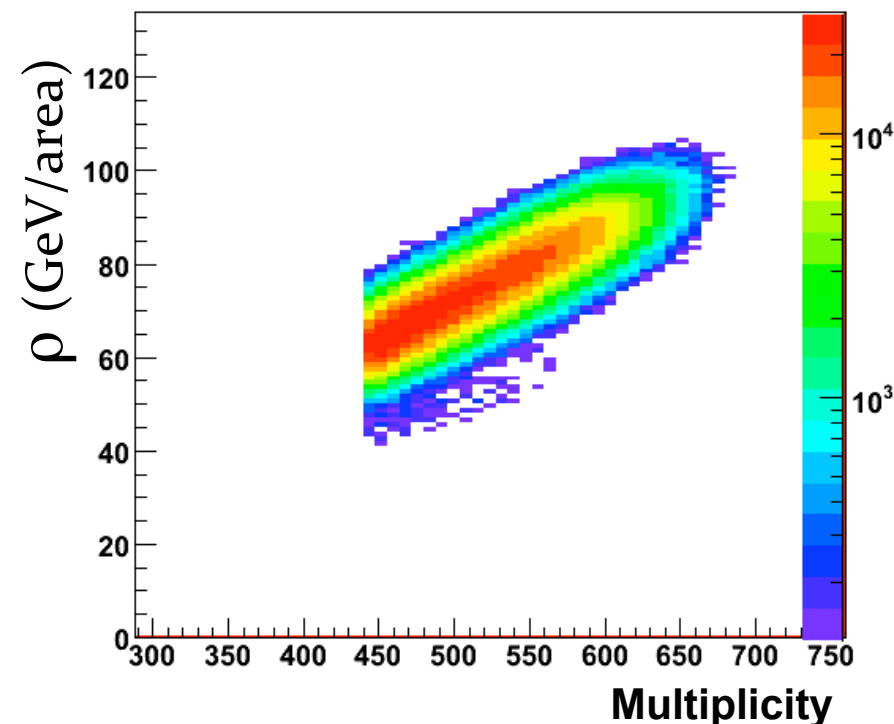

~ 45 GeV for $R_C=0.4$

(S/B ~ 0.5 for 20 GeV jet)

Substantial region-to-region background fluctuations

comparable magnitude in σ from FastJet and naïve random cones

$\sim 6-7$ GeV for $R_C=0.4$

“Fake-Jet” contribution

“Fake” jets: signal in excess of background model from random association of uncorrelated soft particles (i.e. not due to hard scattering)

- **Inclusive jet spectrum:**

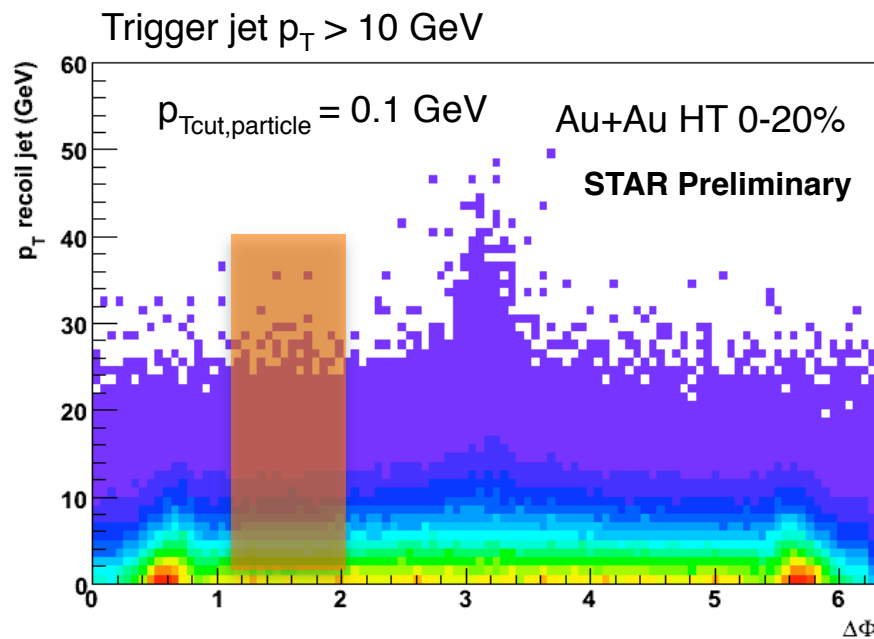

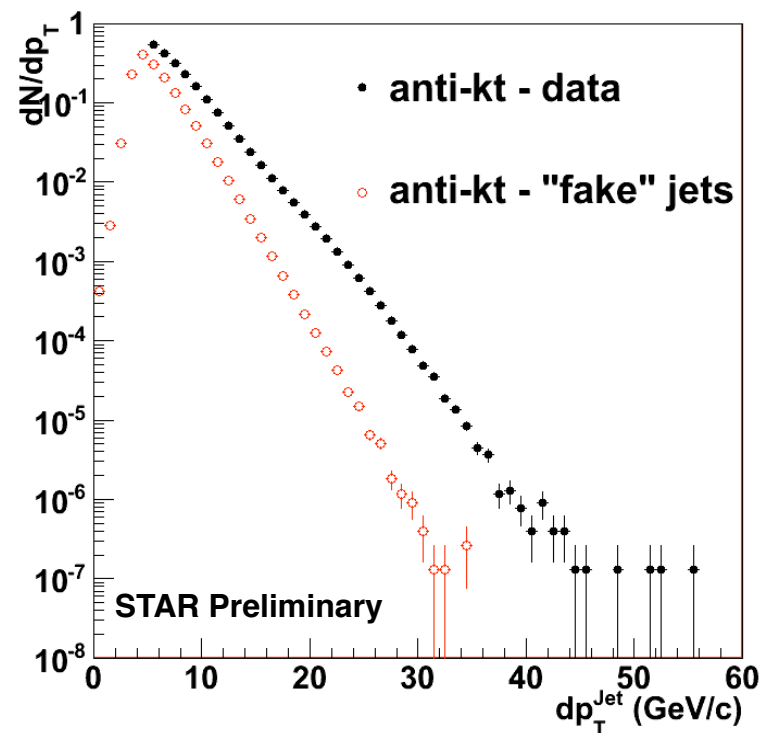

Spectrum of “jets” after randomizing HI event in ϕ and removing leading jet particle

- **Di-Jet / Fragmentation function:**

Background di-jet rate

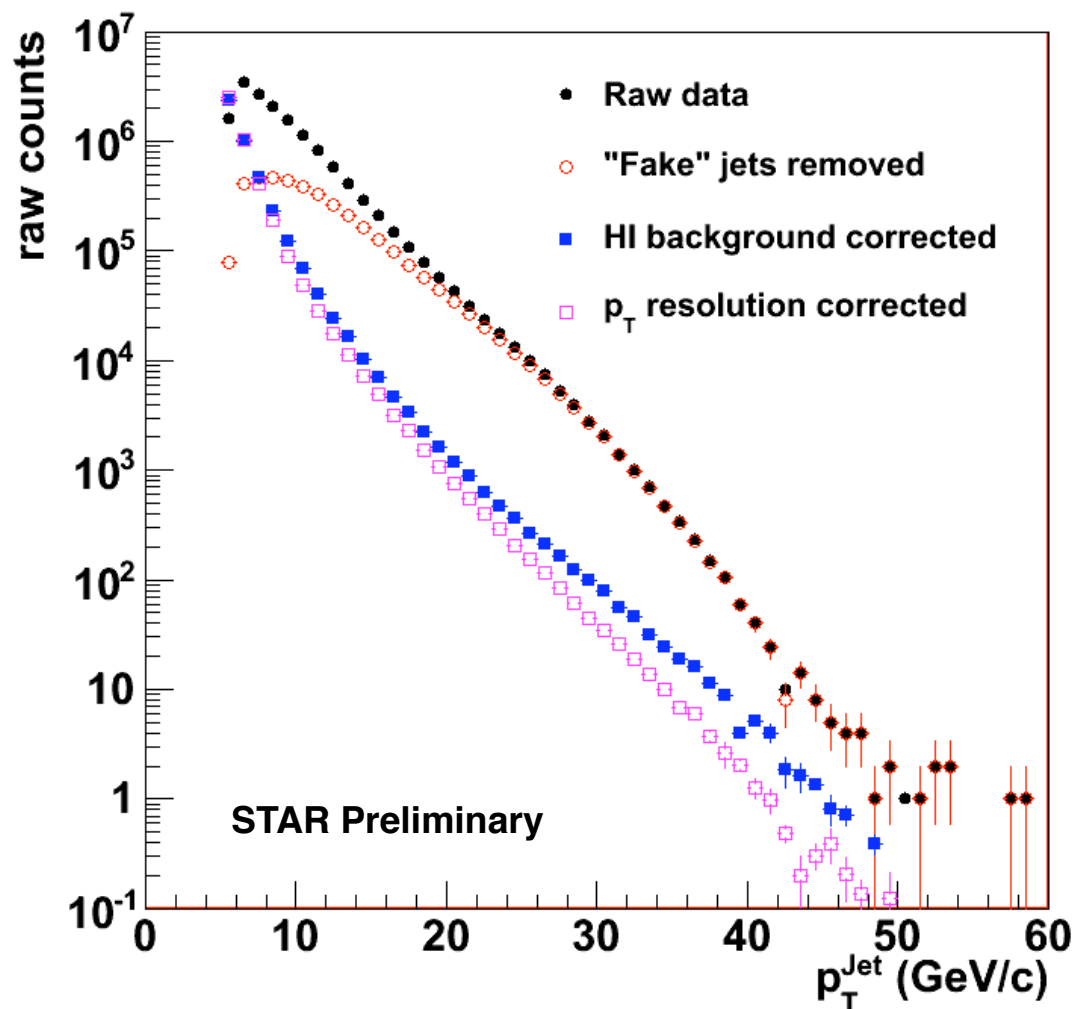

= “Fake” + Additional Hard Scattering

Estimated using “jet” spectrum at 90 deg.

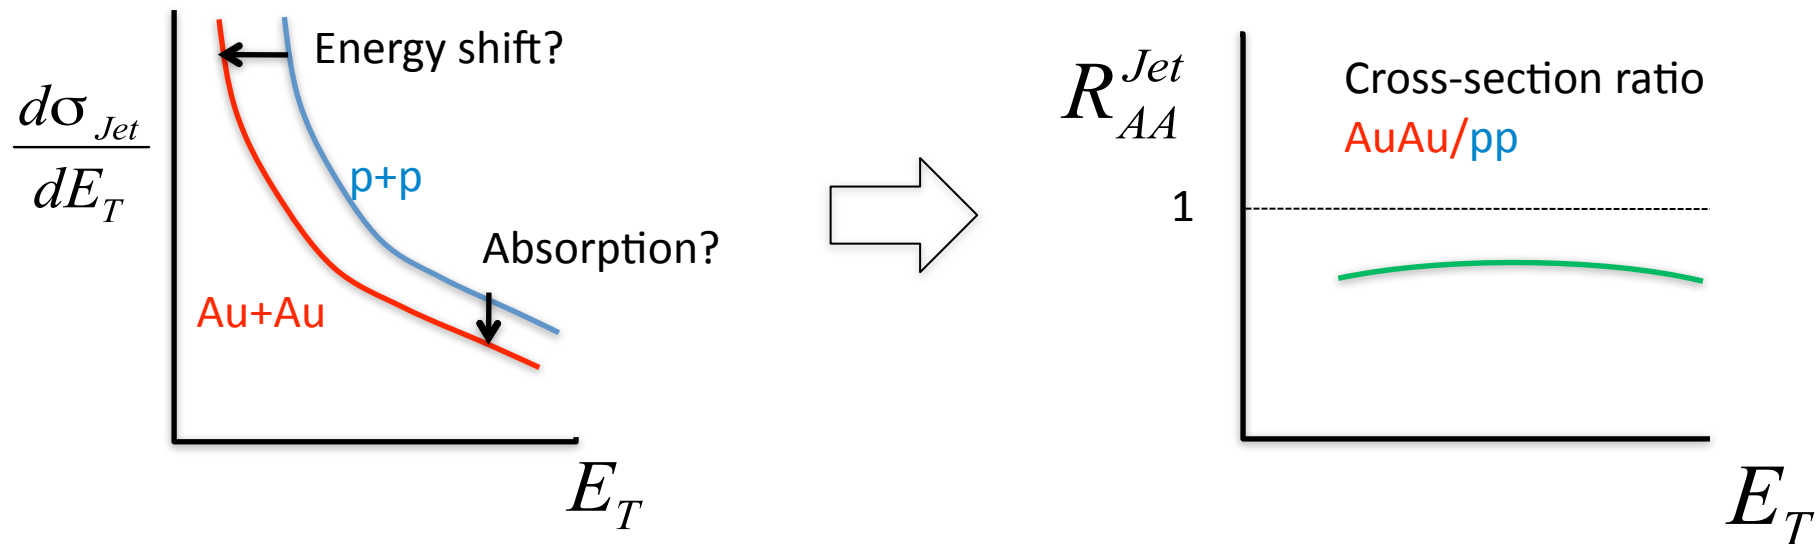

Corrections for smearing of jet p_T due to HI bkg. nonuniformities:

- 1) raw spectrum
- 2) removal of “fake”-correlations
- 3) unfolding (bayesian) of HI bkg. fluctuations
- 4) correction for p_T resolution

What do we learn from the AuAu jet spectrum ?

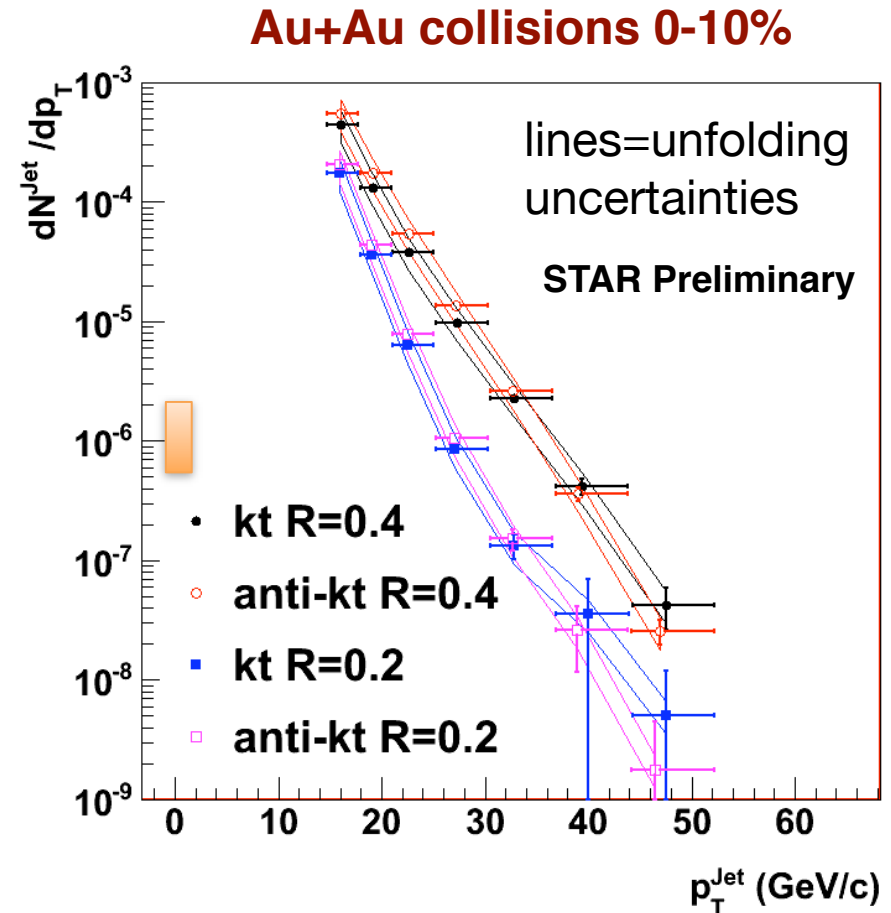

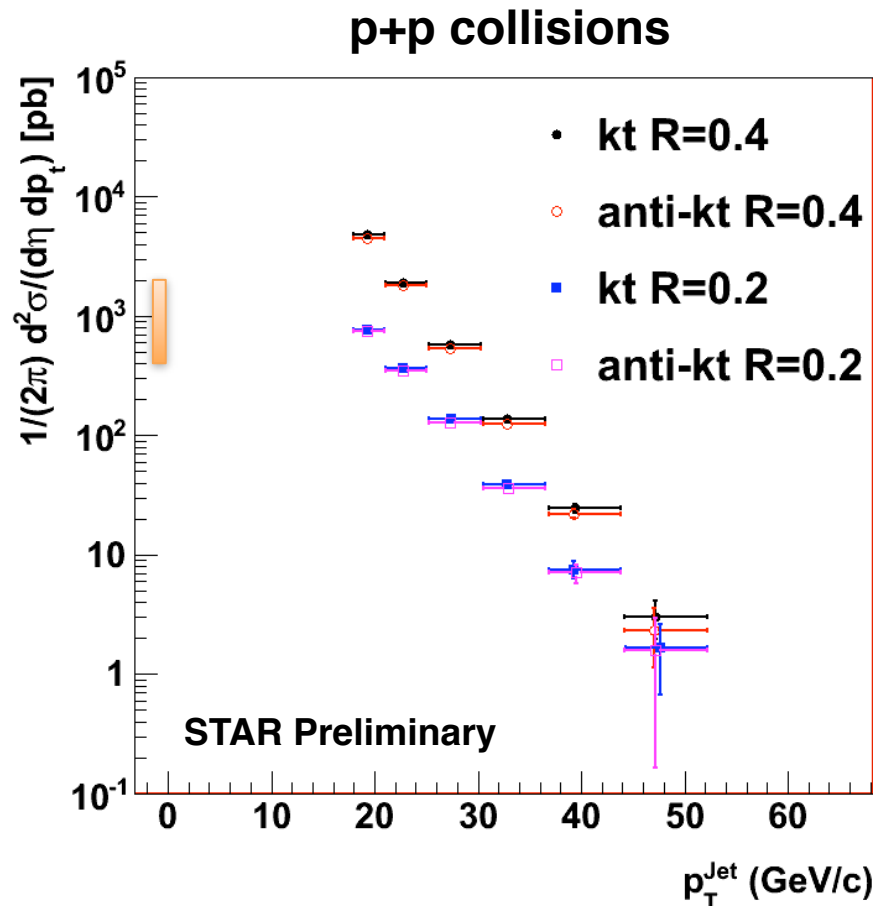

Momentum and energy is conserved even for quenched jets

If full jet reconstruction in heavy-ion collisions is unbiased

\Rightarrow Inclusive jet spectrum scales with N_{binary} relative to p+p

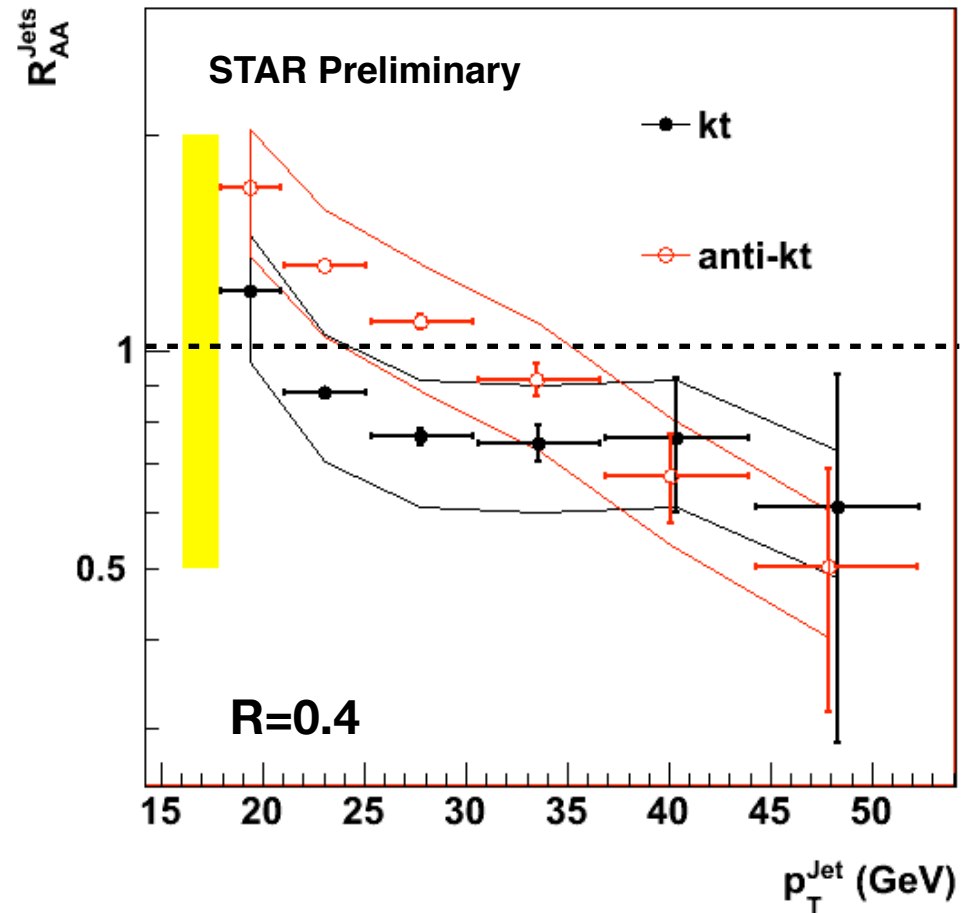

Caveat: Initial state nuclear effects at large x;
"EMC effect" can be measured in d+Au

Inclusive jet x-section in central Au+Au

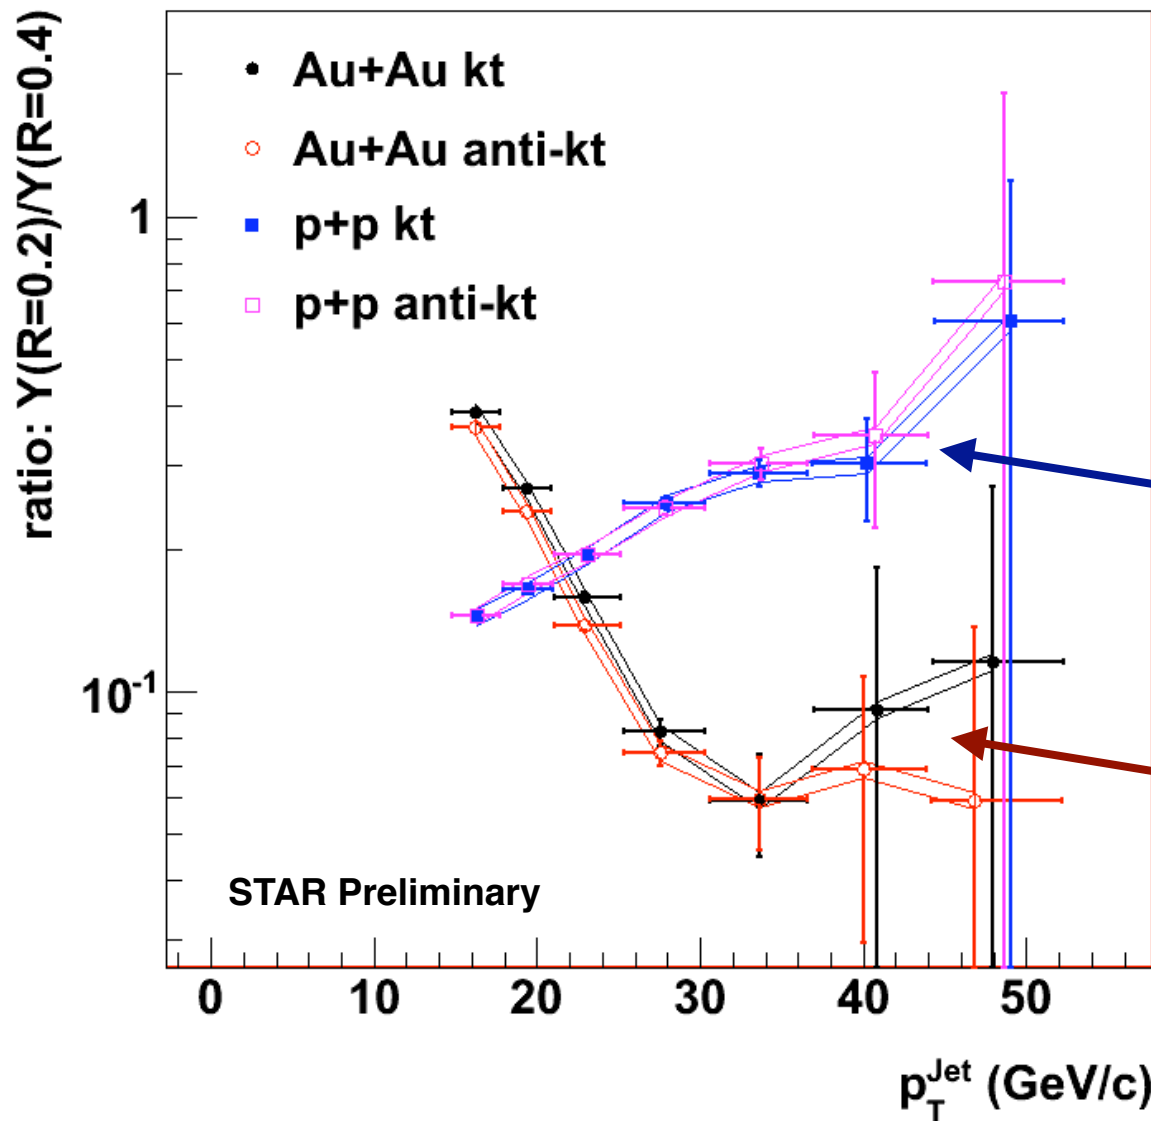

- Inclusive Jet spectrum measured in central Au+Au collisions at RHIC
- Extended the kinematical reach to study jet quenching phenomena to jet energies > 40 GeV

Jet R_{AA} in central Au+Au

- We see a substantial fraction of jets
- in contrast to x5 suppression for light hadron R_{AA}
- k_T and Anti- k_T known to have different sensitivities to background

First look at the jet energy profile

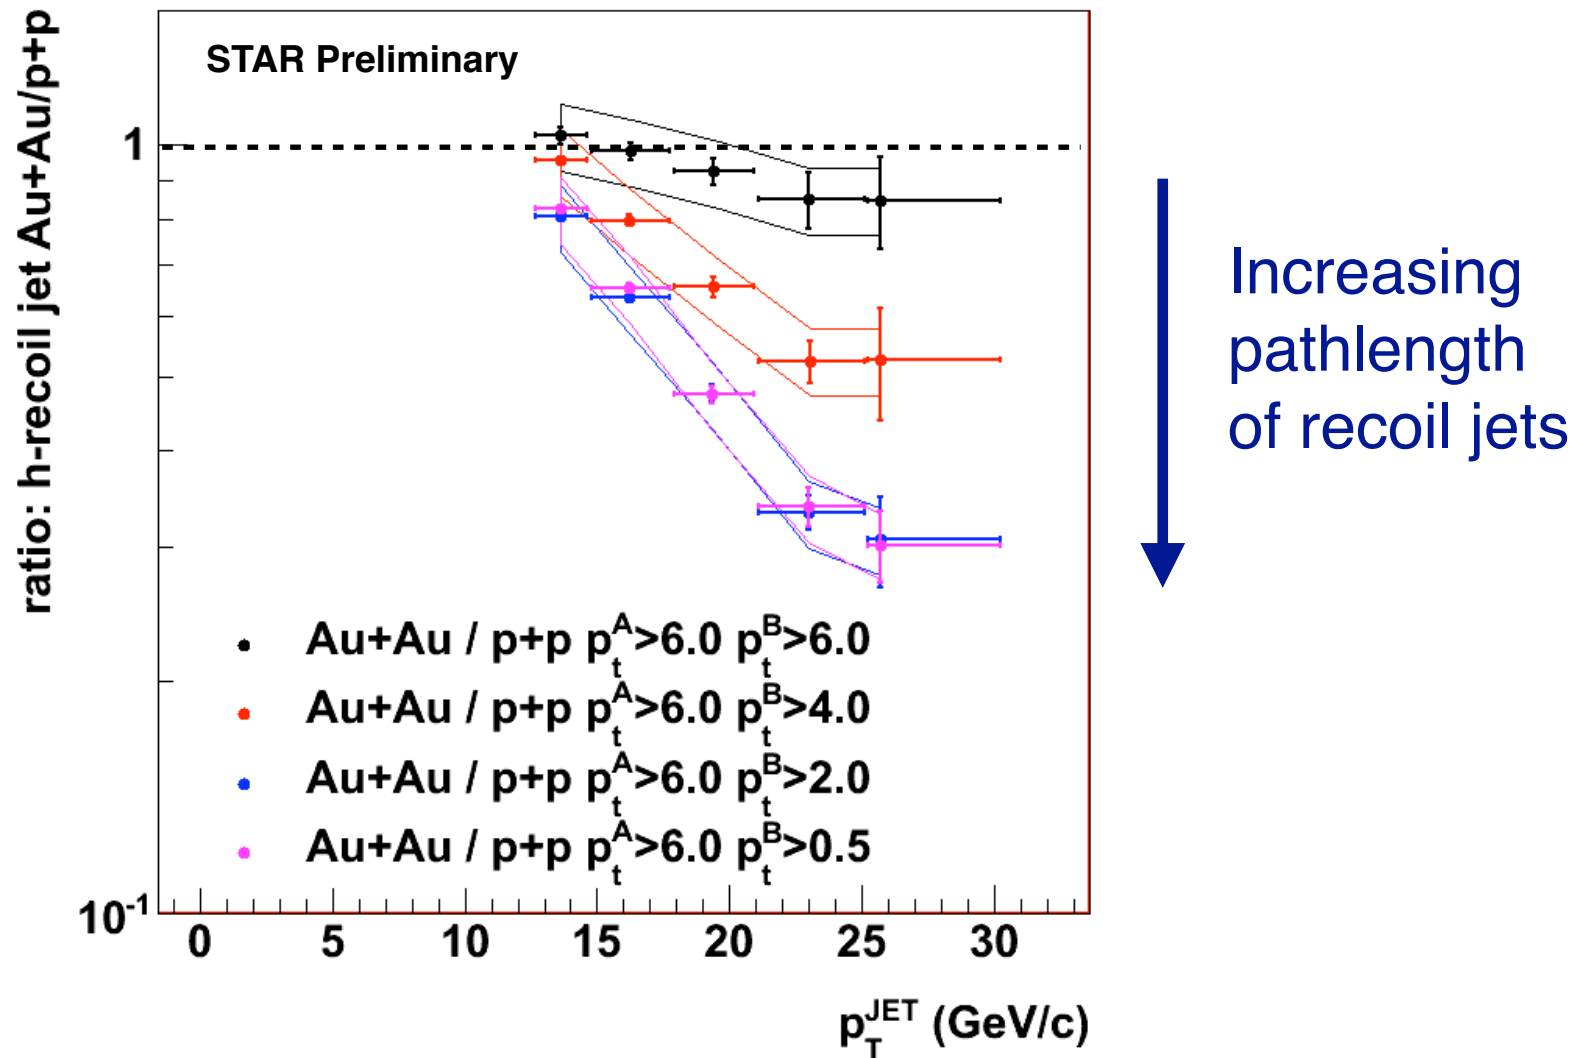

p+p: “Narrowing” of the jet structure with increasing jet energy

Au+Au: “Deficit” of jet energy of jets reconstructed with $R=0.2$

Strong evidence of broadening in the jet energy profile

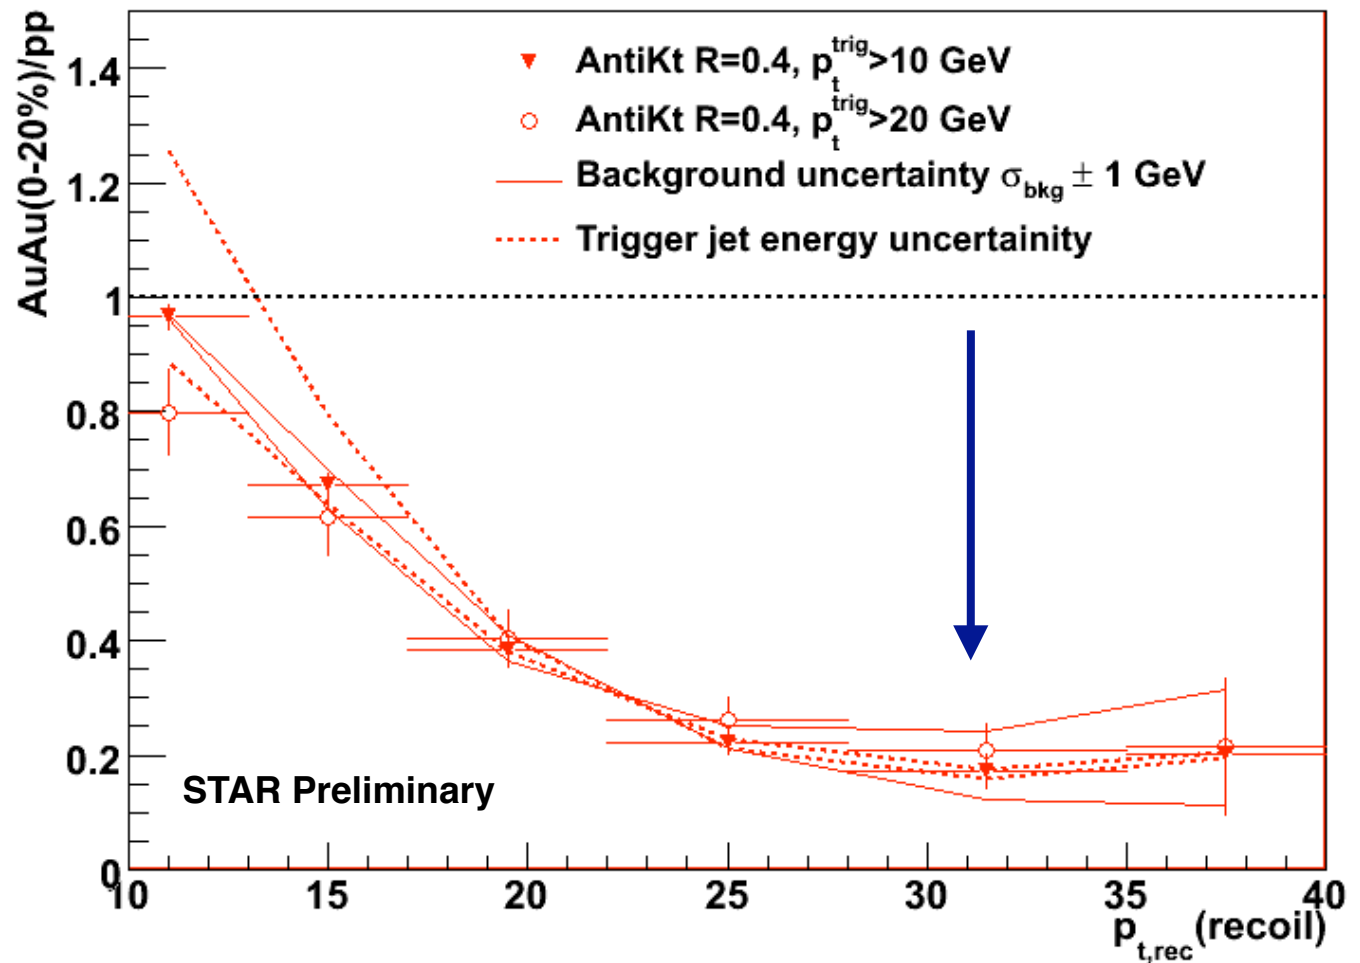

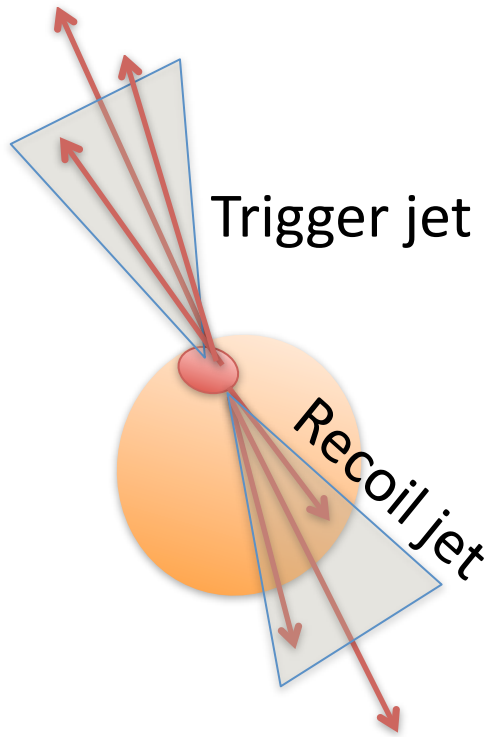

Exploring pathlength dependence for recoil jets

Trigger on high $p_T \pi^0$ and look at jet recoil spectrum

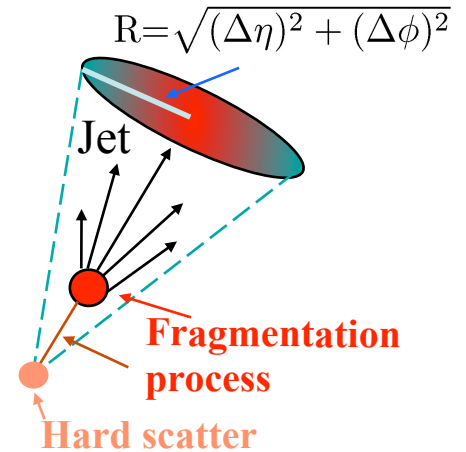

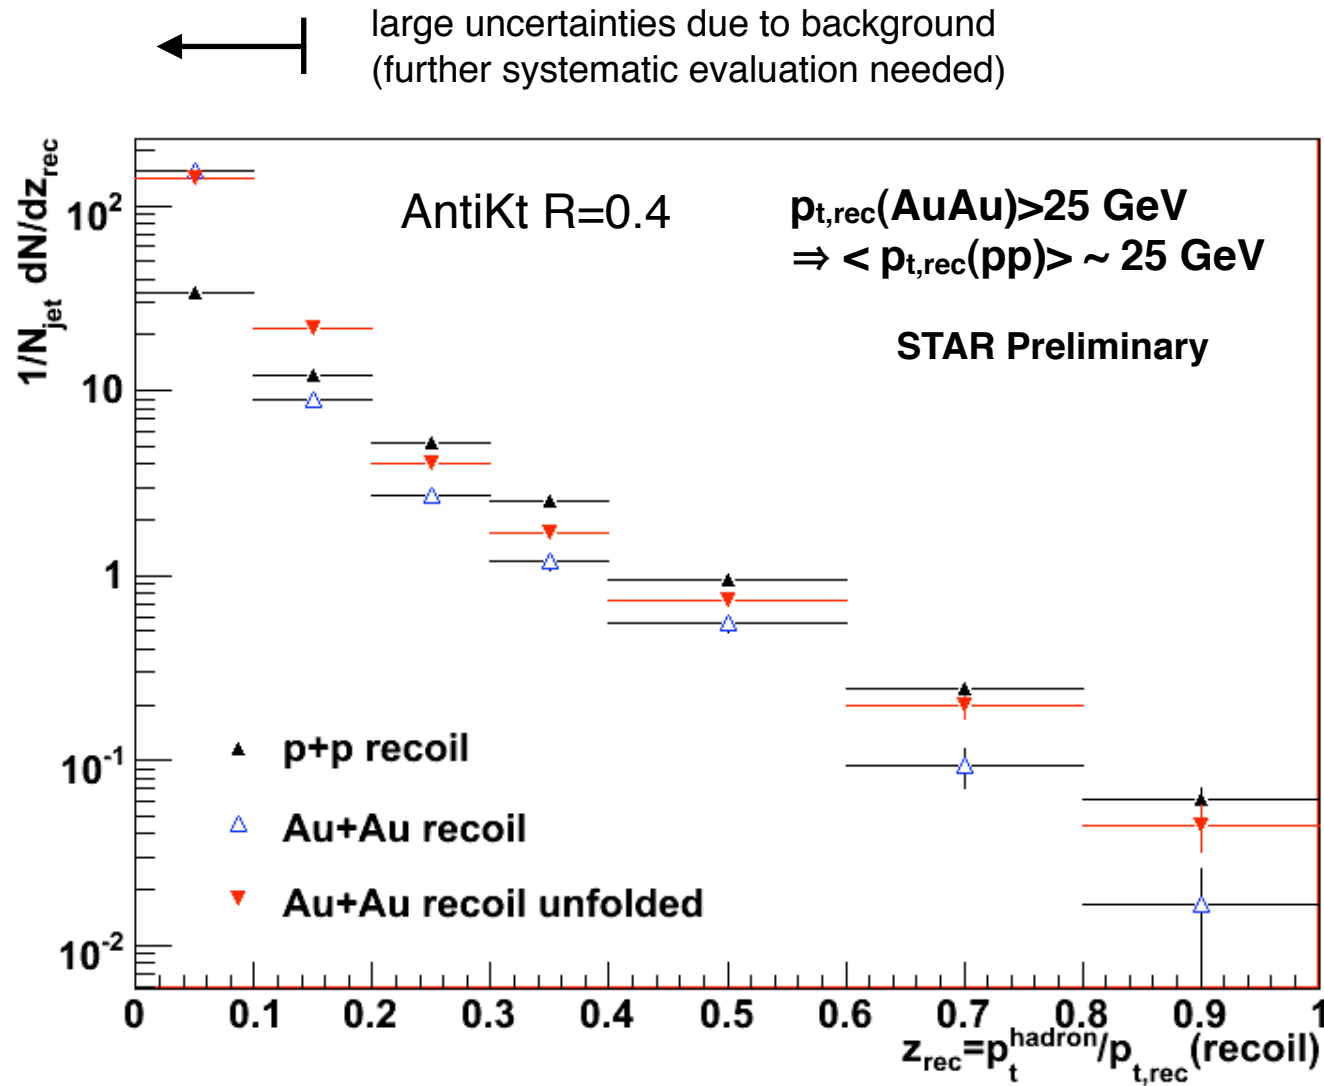

Significant suppression in hadron-jet coincidence measurements of the unbiased recoil jet spectrum

Recoil jet spectrum R_{AA}

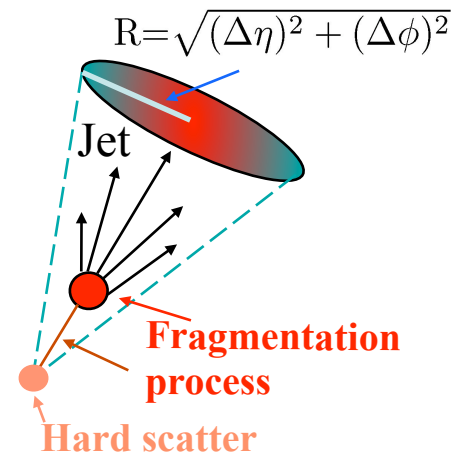

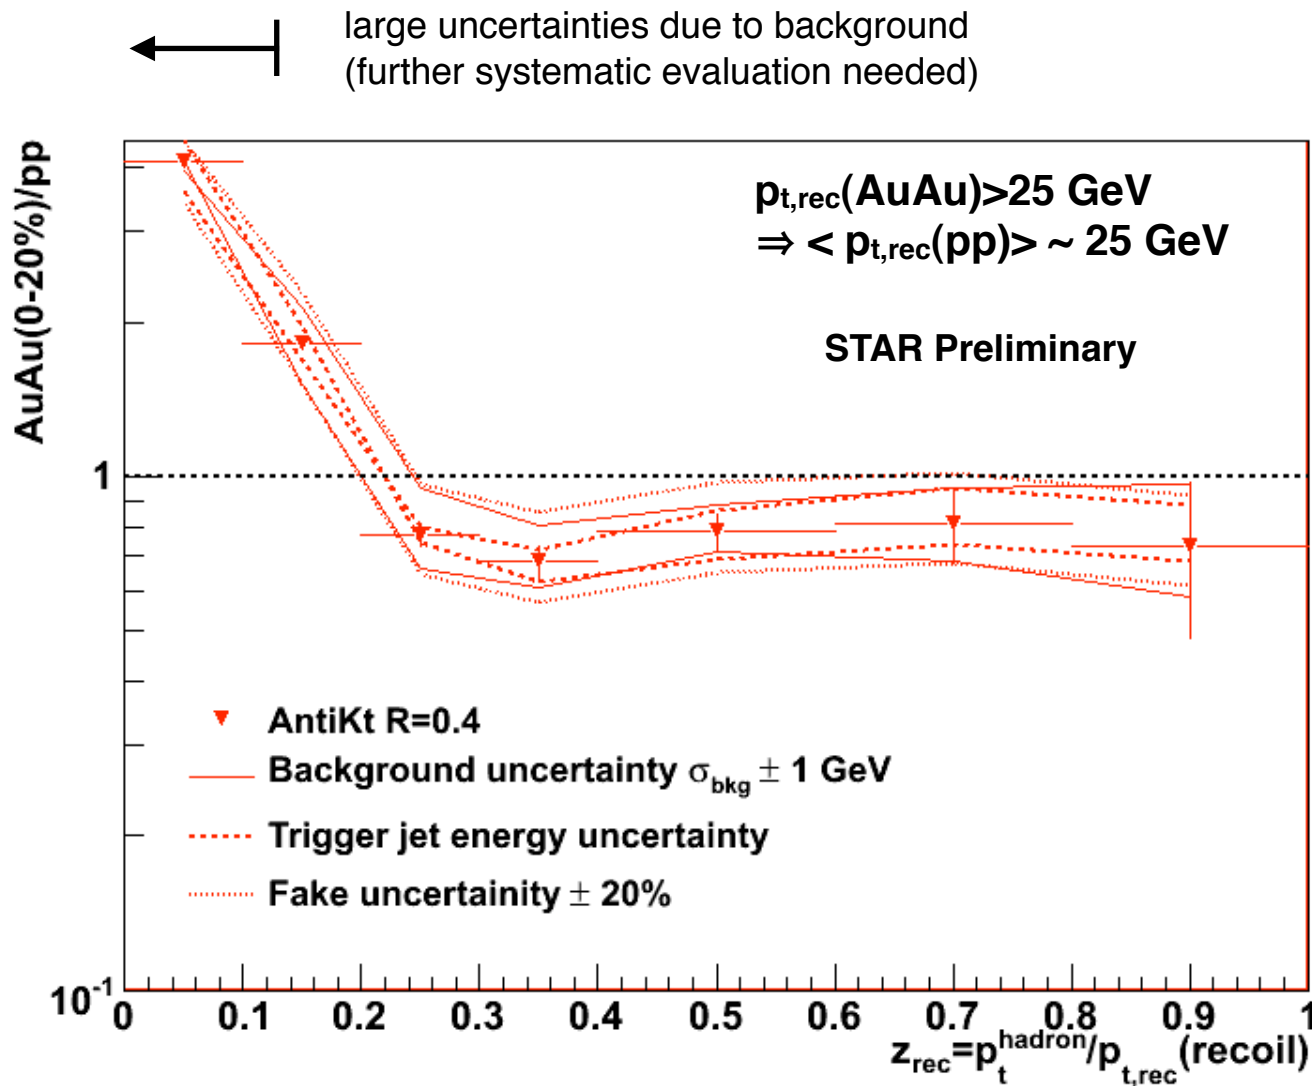

- Selecting unmodified trigger jet maximizes pathlength for the back-to-back jets: “extreme” selection of jet population
- Significant suppression in di-jet coincidence measurements

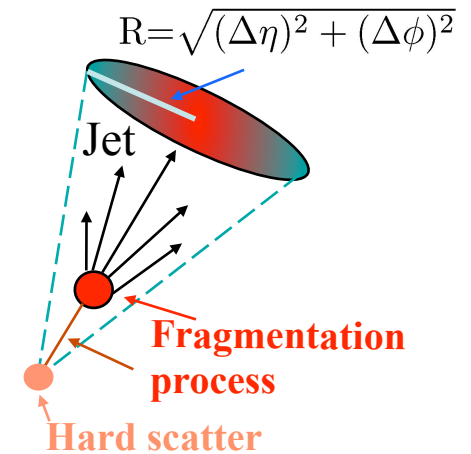

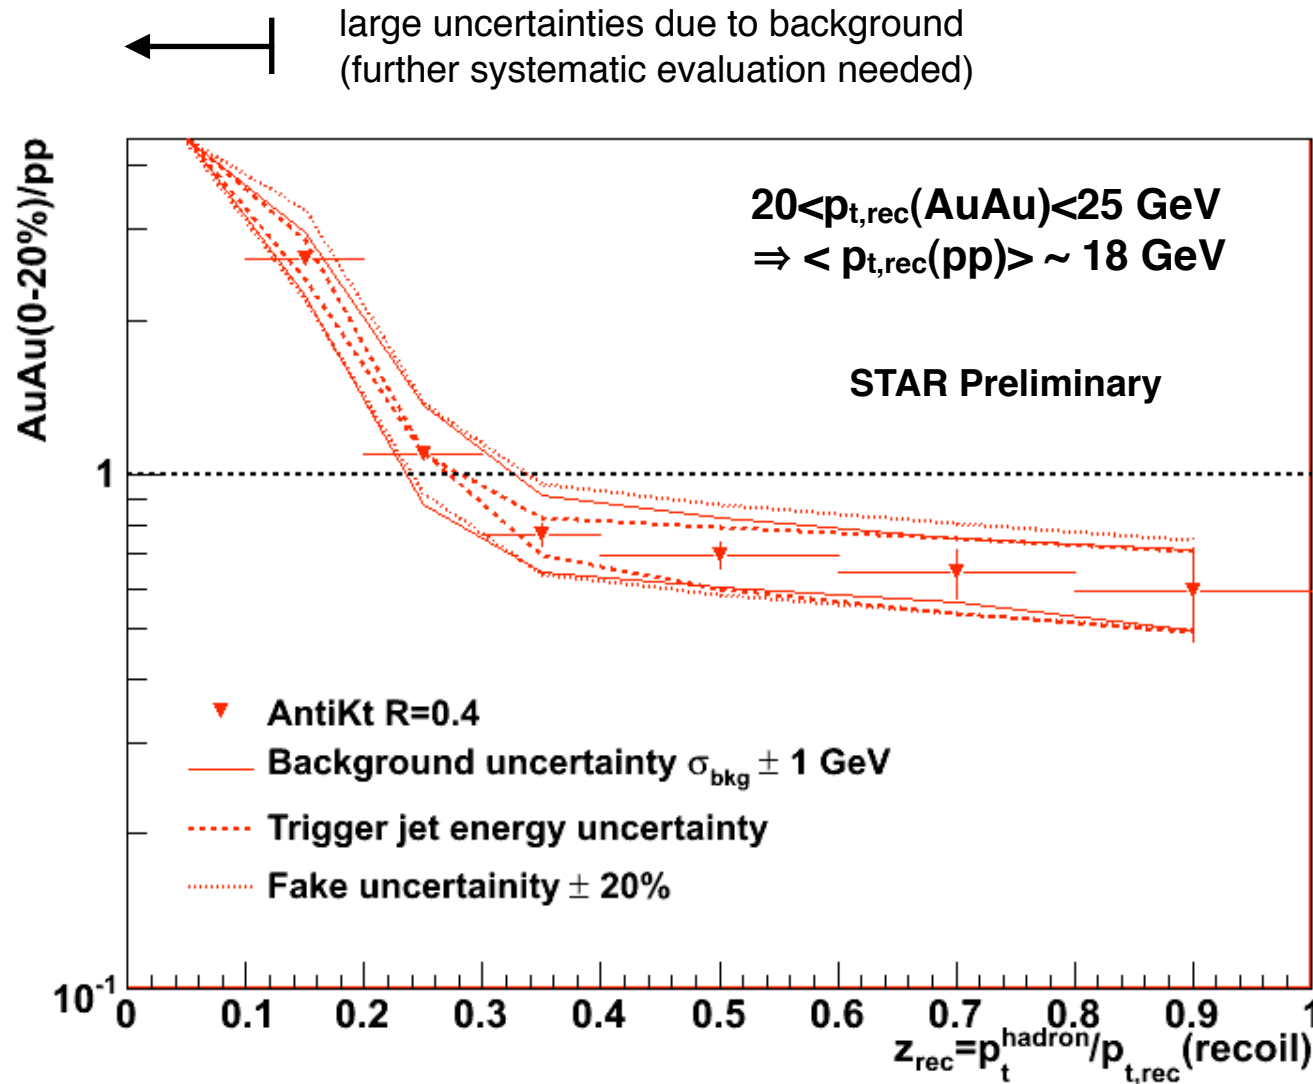

Recoil Fragmentation Function in Au+Au collisions

Recoil Fragmentation Function in Au+Au collisions

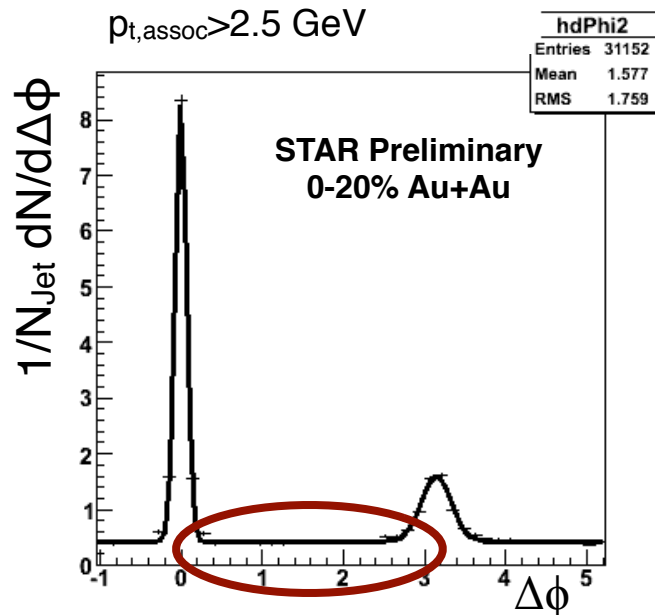

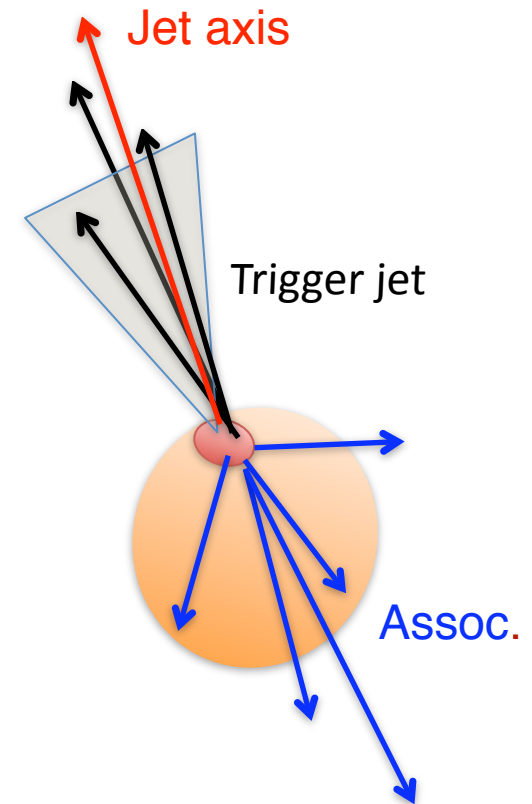

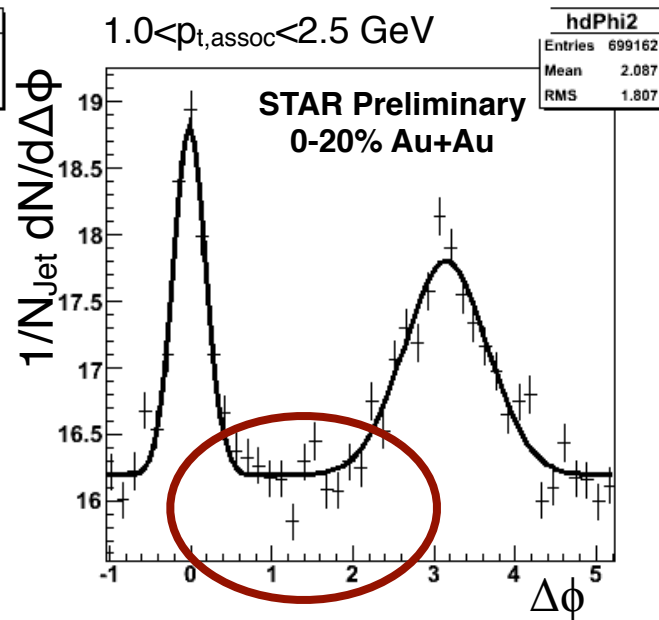

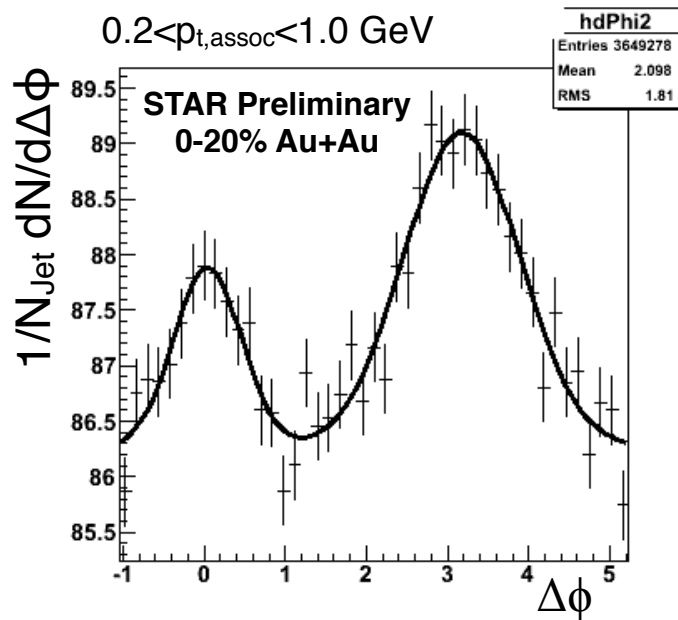

Recoil Fragmentation Function in Au+Au collisions

Indication of modification in the fragmentation function for lower jet $p_t < \langle p_{t, \text{rec}}(\text{pp}) \rangle \sim 18 \text{ GeV}$

Unsubtracted Jet-Hadron correlations 0-20% Au+Au

High Tower Trigger (HT): tower 0.05x0.05 ($\eta \times \phi$) with $E_t > 5.4$ GeV

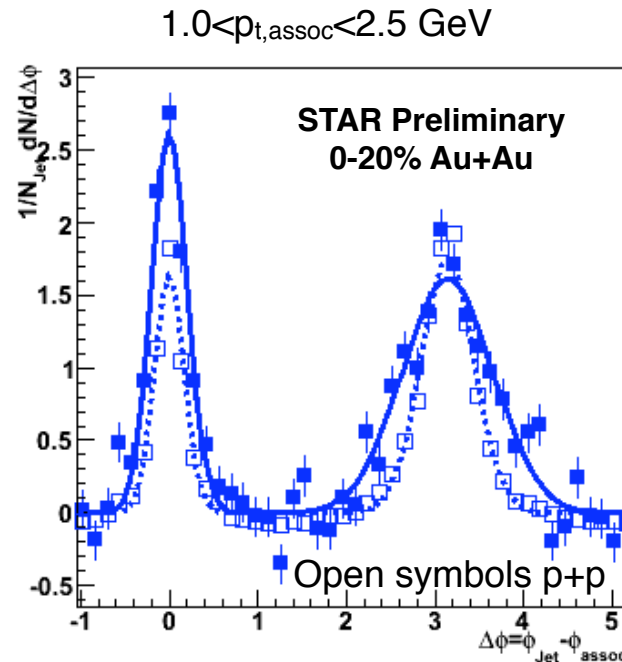

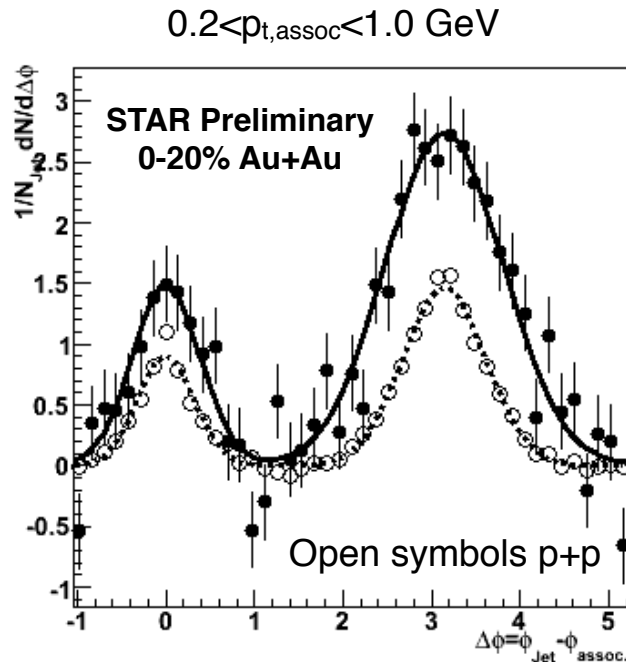

$$\Delta\phi = \phi_{\text{Jet}} - \phi_{\text{Assoc.}}$$

ϕ_{Jet} = HT trigger jet-axis found by Anti-kt with $R=0.4$, $p_{t,cut} > 2$ GeV and $p_{t,rec}(\text{jet}) > 20$ GeV

- Jet v_2 contribution under investigation
- Use 2 gaussian + constant fit to describe the azimuthal correlation function

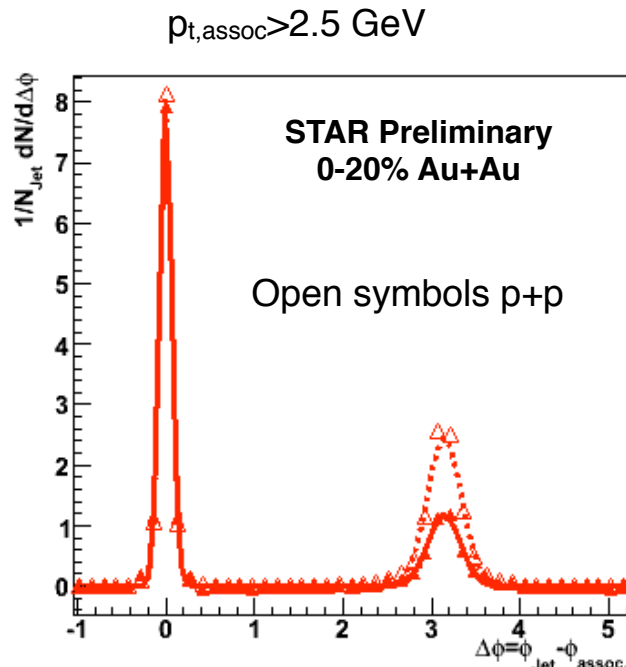

Jet-hadron correlations 0-20% Au+Au vs. p+p

High Tower Trigger (HT):
tower 0.05x0.05 ($\eta \times \phi$)
with $E_t > 5.4$ GeV

$$\Delta\phi = \phi_{Jet} - \phi_{Assoc.}$$

ϕ_{Jet} = HT trigger jet-axis found by
Anti-kt with $R=0.4$,
 $p_{t,cut} > 2$ GeV and
 $p_{t,rec}(jet) > 20$ GeV

- Significant broadening and softening visible on the recoil side
- “Modified fragmentation function”
- “Not” visible in di-jets, suggesting that current jet-finding approach is biased towards less interacting jets and/or underestimation of jet energy

Summary

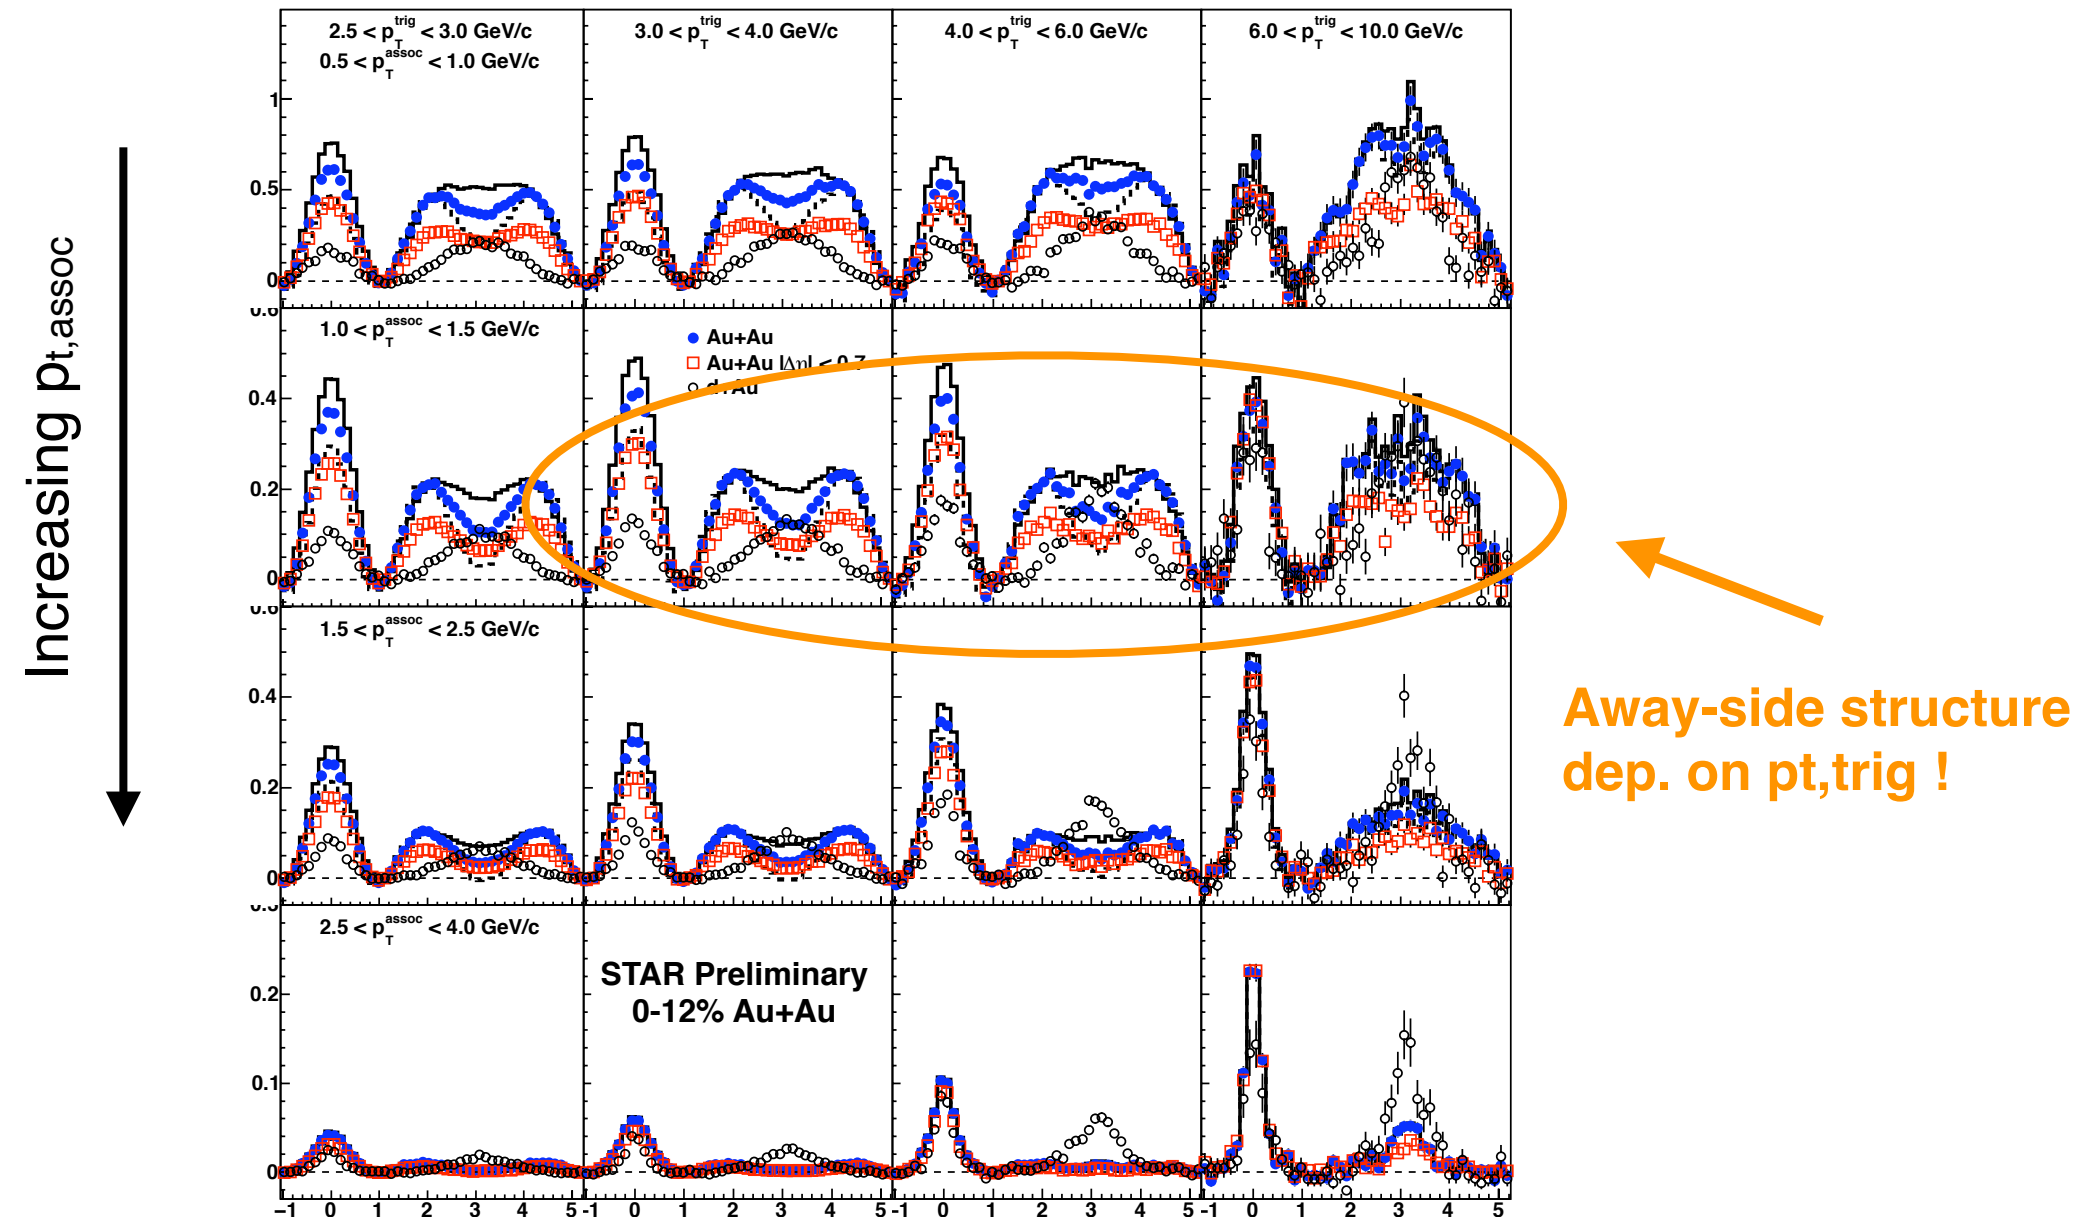

- Jet reference measurements (p+p and d+Au) well understood
- Significantly larger fraction of the jet population measured via full-jet reconstruction wrt to single inclusive measurements
- Strong evidence of broadening in the jet energy profile
- Significant suppression of hadron-jet and di-jet coincidence yields in central Au+Au collisions
- Only small modifications of the recoil-jet fragmentation function
- Jet-hadron correlations show a significant broadening and softening of the recoil jet \Rightarrow “modified” fragmentation function

Picture emerging: Current results from full-jet reconstruction in heavy-ion collisions at RHIC can be explained (qualitatively) by significant broadening of the jet structure due to partonic energy loss

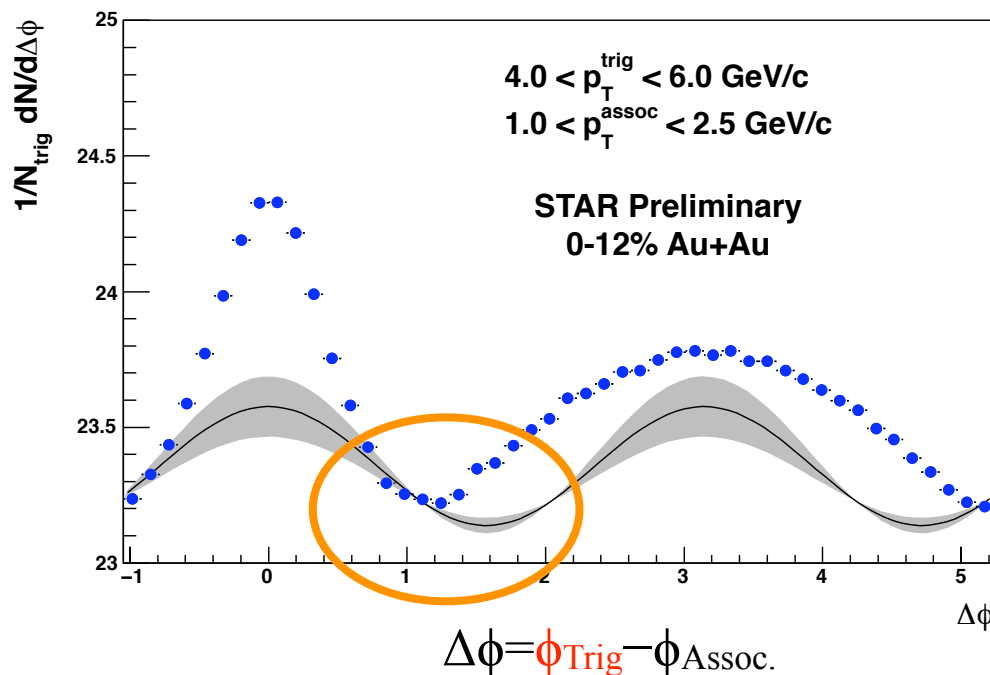

Backup

Di-hadron correlations: Mach-Cones @ RHIC ?

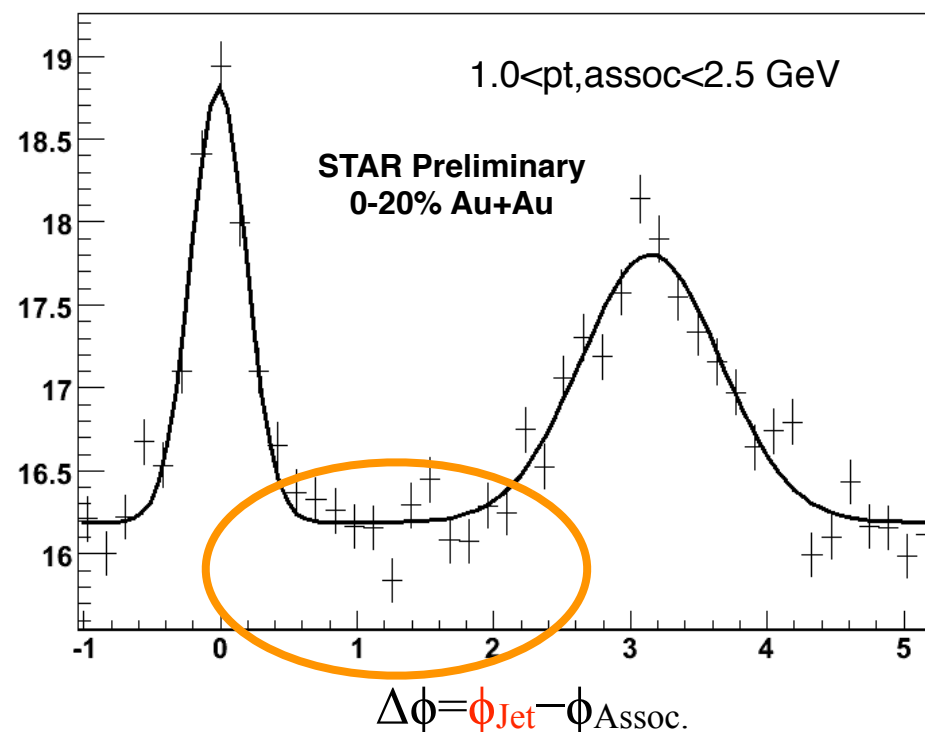

Increasing $p_{t, \text{trigger}}$

Unsubtracted Jet-hadron vs. di-hadron

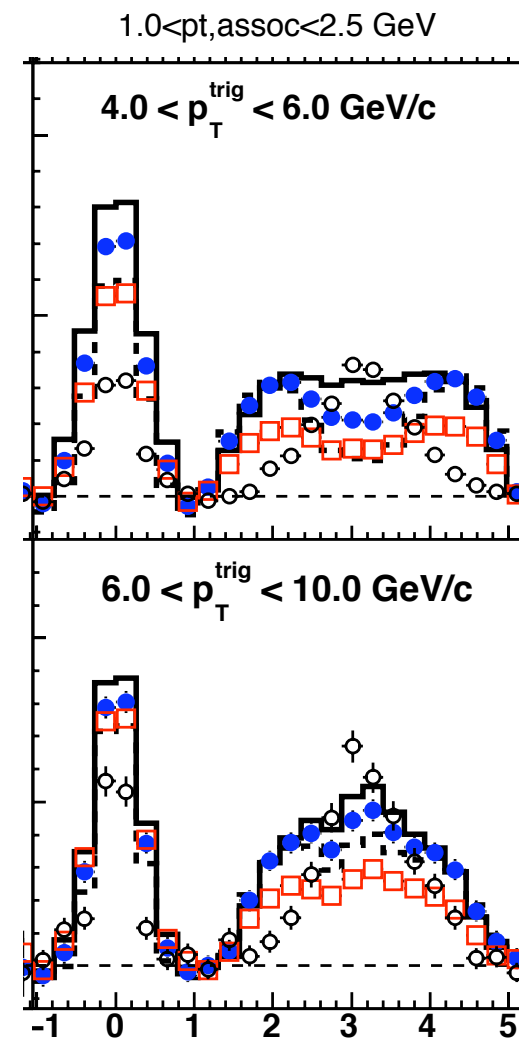

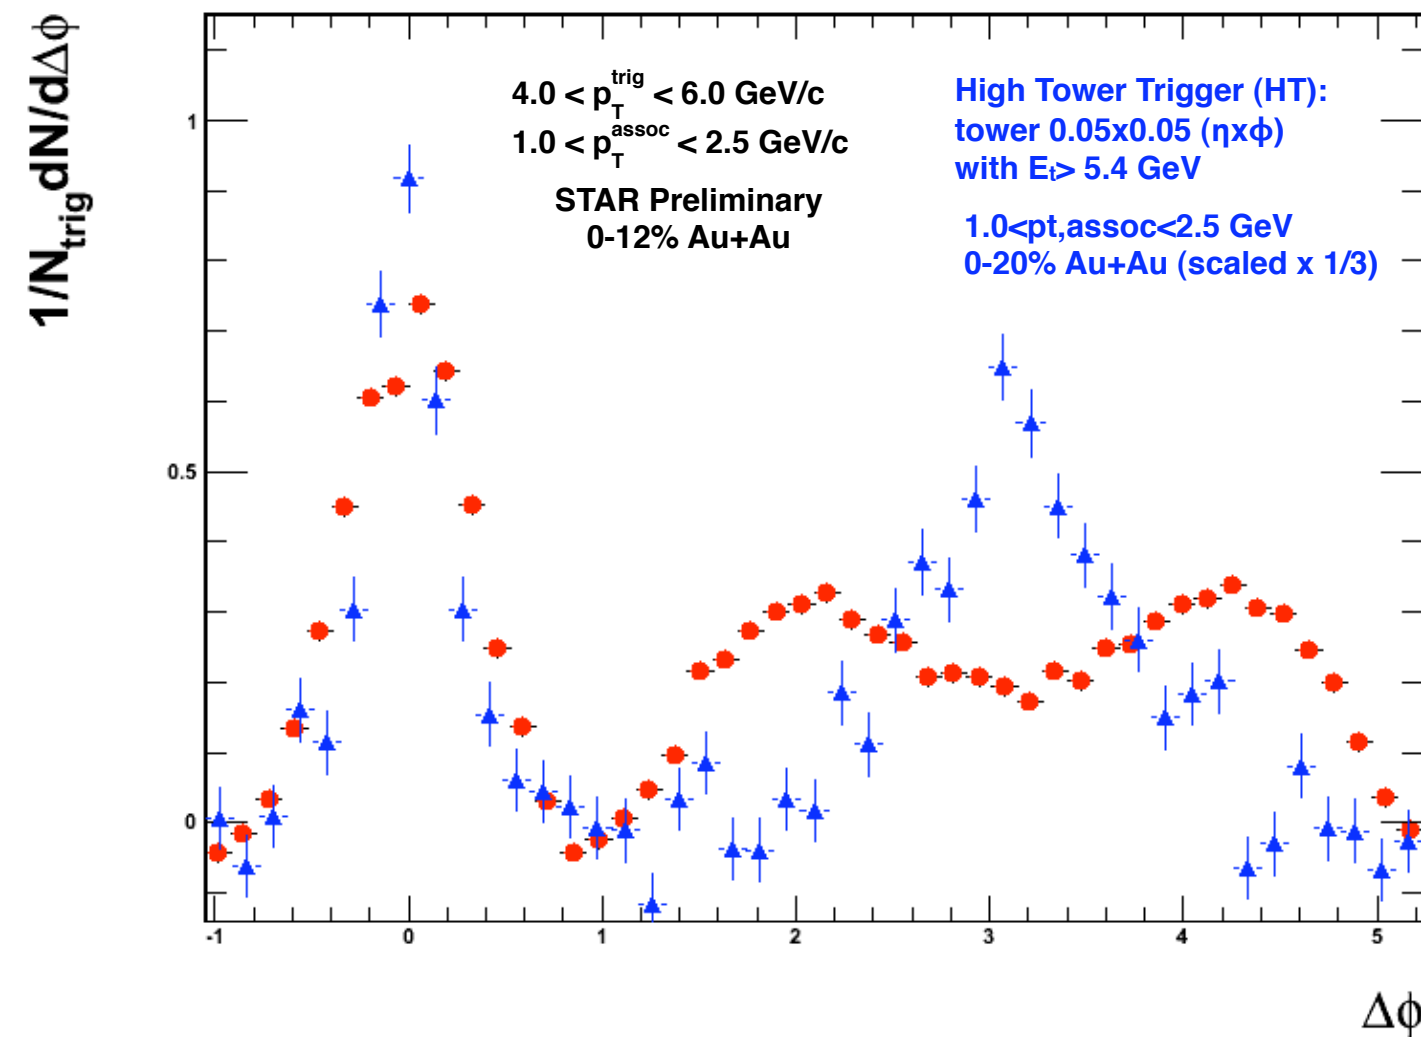

High Tower Trigger (HT): tower 0.05×0.05 ($\eta \times \phi$) with $E_t > 5.4 \text{ GeV}$

- No apparent v_2 modulation in Jet-hadron vs. di-hadron
- jet axis not correlated wrt to the event plane (?)
- v_2 unsubtracted di-hadron correlation does not show mach-cone like structures, only after v_2 subtraction (!?)

Away-side structure: di-hadron vs. jet-hadron

**Jet-hadron away-side significantly narrower than di-hadron
 => can not be explained by punch-trough only/ no wings (!)**

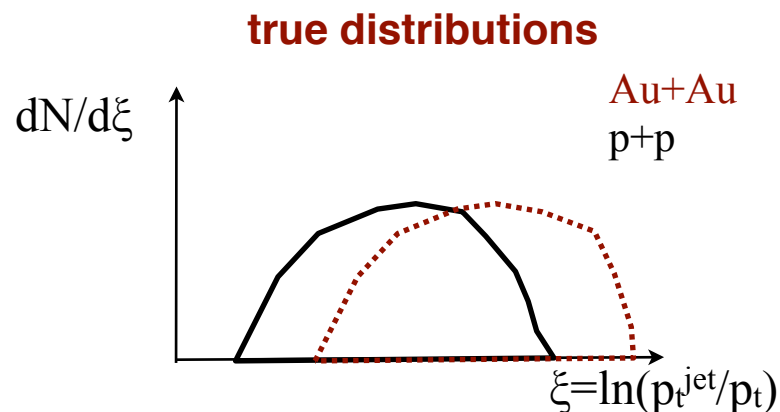

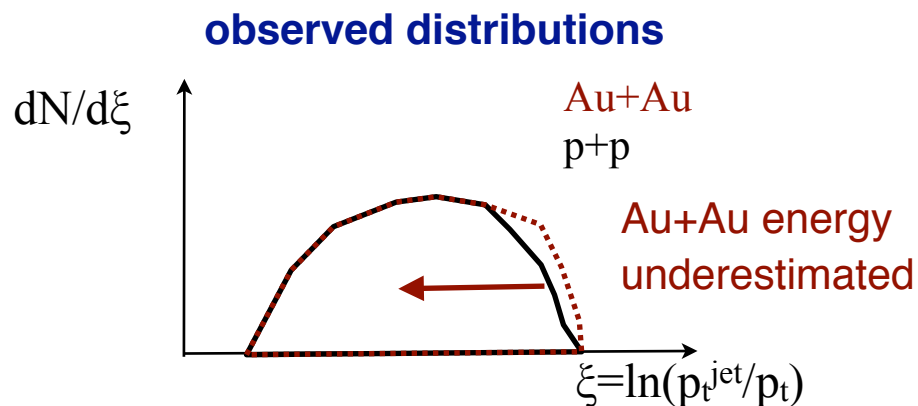

Two scenarios:

1) Jet-energy bias due to energy loss and p_t^{cut} :

Pythia-based correction underestimates jet energy carried by low p_t particles

→ **Au+Au jet energy is underestimated**

Large Au+Au quenching:

2) “black-and-white”:

Some fraction of jets quenched so much that they are lost; surviving jets are unmodified

We have all the tools and data needed to address and distinguish between these two scenarios, but MC quenching model needed !
